The Archaeology of the McNair Site (ALGu-8)

A Report on the Stage 3-4 Mitigative Excavation of the McNair Site (ALGu-8) Block 12, OPA 400

Draft Plan of Subdivision 19T-89124 (Major Bob Farms Inc.) And Draft Plan of Subdivision 19T-99V-08 (Andridge Homes Limited Lands) Part of Lots 24 and 25, Concession 2 in the City of Vaughan Regional Municipality of York, Ontario

EXECUTIVE SUMMARY

Archaeological Services Inc. was contracted by Malone Given Parsons Ltd., on behalf of Andridge Homes Limited and Major Bob Farms Inc. of Markham, Ontario to conduct a Stage 3-4 salvage excavation of the McNair site (ALGu-8), located within the Block 12 Development, OPA 400 (19T-89124 Major Bob Farms Inc. and 19T-99V-08 Andridge Homes Limited Lands) in part of Lots 24 and 25, Concession 2, City of Vaughan, Regional Municipality of York, Ontario.

The Stage 3 excavations were conducted in 1998, 1999 and in 2003, and involved the pedestrian survey of the Andridge Homes Limited Lands and Major Bob Farms Inc. lands, the controlled surface collections of the artifacts encountered and the excavation and hand-screening of test units at five metre intervals across the site and within the two middens. This work was conducted under the project direction of Mr. Martin Cooper, and under the supervision of Dr. Shaun Austin (1998), Dr. Bruce Welsh (1999) and Mr. Robert Pihl (2003) (MTCS CIF #P057-010).

The Stage 4 excavation was conducted under the project management of Dr. Ronald Williamson and the field direction of Mr. Robert Pihl, Dr. Bruce Welsh and Mr. David Robertson between 2003 and 2004 (MCL P050-032 and P057-016). The Stage 4 archaeological mitigation of the McNair site (ALGu-8) involved the removal of approximately 15,200 square metres of topsoil by mechanical means revealing a settlement pattern consisting of eight longhouses and ten discrete exterior activity areas. Two middens were identified and hand-excavated in one metre square units to sterile subsoil. A total of 74,594 artifacts was recovered from the 2003-2004 Stage 4 salvage excavation of the site, consisting of ceramics, flaked and ground stone, copper artifacts and floral and faunal remains. The analysis of the archaeological data suggests that the site is a mid-fifteenth century A.D. ancestral Wendat village.

This report represents the fulfillment of our 2003-2004 licensing agreement with the Ontario Ministry of Culture and the statements contained on the CIFs P050-032(Robertson) and P057-016 (Pihl). It is concluded, therefore, that the McNair site (ALGu-8) on the subject property has been fully investigated.

1.0 INTRODUCTION: THE EXCAVATION OF THE MCNAIR SITE AND PREVIOUS REGIONAL RESEARCH

Andrea Carnevale and David Robertson

Archaeological Services Inc. was contracted by Malone Given Parsons Ltd., on behalf of Andridge Homes Limited and Major Bob Farms Inc. of Markham, Ontario to mitigate all portions of the McNair site (AlGu-8) through salvage excavation. This assessment was part of a larger project involving the Stage 1-4 archaeological resource assessments within the Block 12 (OPA 400) development area in the City of Vaughan, Regional Municipality of York, Ontario (Figure 1). The assessment of Block 12 commenced in 1997 under the project direction of Mr. Martin Cooper, and entailed preliminary fieldwork in August and October of 1998 and October of 1999, under the supervision of Dr. Shaun Austin (1998) and Dr. Bruce Welsh (1999). The 2003 Stage 3-4 investigations at McNair were carried out under the project management of Dr. Ronald Williamson and the field direction of Mr. Robert Pihl (July through December of 2003) while Dr. Bruce Welsh directed the 2004 work (May through September 2004). Mr. David Robertson also provided field direction from 2003 through 2004. All fieldwork at the site was conducted in accordance with the Ontario Heritage Act (1990) under archaeological licences 97-017, 98-014, P057, and P050 (CIF #P057-010, P057-016, and P050-032).

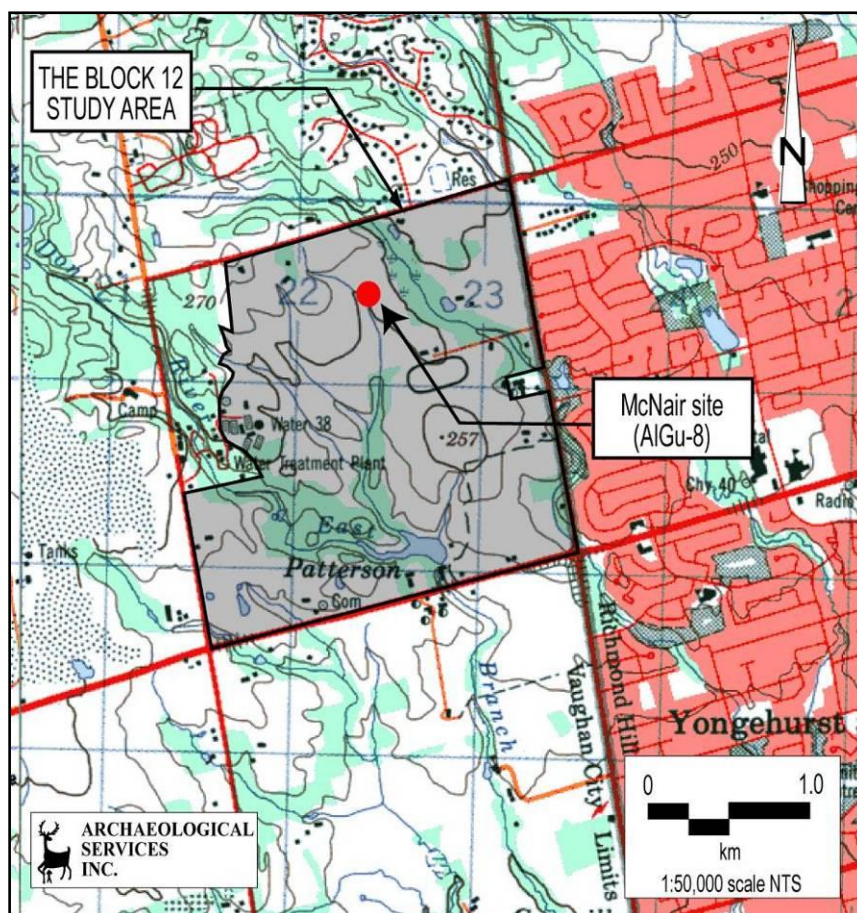

Figure 1: Location of the McNair site (AlGu-8)
(NTS Sheets 30M14[Markham], ed.9 1994 & 30M/13 {Bolton}, ed. 7 1994)

The McNair site is a plough-disturbed Late Iroquoian period village settlement, dating to the mid-fifteenth century, encompassing a total area of approximately 1.0 hectare. The site extends across the southeastern portion of Lot 25 (Andridge Homes Limited) into the northern portion of Lot 24 (Major Bob Farms Inc.).

This document constitutes the final report of the Stage 3 assessment and Stage 4 excavation, which was conducted in 2003-2004. The report is divided into nine major sections. The first reviews the previous research conducted on the site, the environmental setting and the methods and techniques employed in this investigation. The following sections provide detailed descriptions of the settlement patterns, the material culture, and the evidence related to the subsistence strategies of the site's occupants. The final section provides a summary and interpretation of the data presented.

1.1 Physiographic Setting

The McNair site is located within the South Slope physiographic region, which forms the southern flanks of the Oak Ridges Moraine and defines the drainage systems flowing into Lake Ontario. Within the Regional Municipality of York, east of Highway 400, the South Slope region is smoothed, faintly drumlinized, and scored at intervals by tributaries of the Rouge, Don and Humber Rivers (Chapman and Putnam 1984). The site is situated on rolling terrain that is drained by Patterson Creek, a tributary of the Little Don River. The tableland on which the site is situated is defined by McNair Creek to the east, and the gully of another tributary to the west and north.

1.2 Previous Investigations

In 1997, Stage 1 research was conducted in order to identify any archaeological sites on the Block 12, OPA 400 subject property, within which the Andridge Homes Limited and Major Bob Farms Inc. lands are located, prior to field examination and to assess the property's archaeological potential based on its physiographic setting. Block 12 encompasses Lots 21-25, Concession 2 in the City of Vaughan. It is bounded by Major MacKenzie Drive on the south, Teston Road on the north, Bathurst Street on the east and Dufferin Street on the west. The holdings of the landowners who participated in the Stage 1 archaeological assessment encompassed an area of approximately 400 hectares. During the course of the Stage 1 research, it was determined that the physiographic setting, history of nineteenth century land use, and nearby previously registered archaeological sites together pointed to significant archaeological potential for the property.

Two sites were registered within the Andridge Homes Limited and Major Bob Farm Inc. lands prior to the initiation of the Stage 1 assessment – the **McNair** and **Stephenson sites** (Figures 2-3).

Registered as an Iroquoian village, the **McNair site** (AlGu-8) was identified by A.J. Clarke, an avocational archaeologist who resided in Richmond Hill during the 1920s and 1930s. The McNair site was first documented in the 1920s. Dana Poulton, in his Archaeological

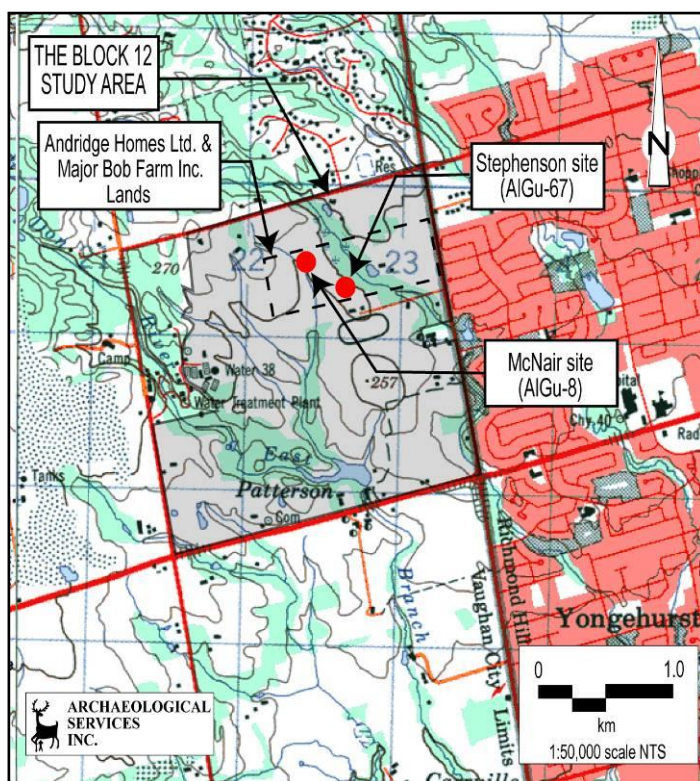

Figure 2: The location of the previously registered sites within the Andridge Homes Ltd. and Major Bob Farm on the Block 12 property

Master Plan of the Town of Vaughan, documented the history of investigations at the McNair site, noting that A.J. Clark visited the site in 1927, and recorded the fact that it extended from Lot 24, then owned by the Stephenson family, northward into Lot 25. In 1929, Clark returned to excavate along the fence line between the two lots, in an area where Aubrey Nico, a collector from Richmond Hill, had previously excavated in deep ashy deposits. At that time, cultivation in both fields had obliterated traces of the site, although in 1931, Clark and Nico found and excavated artifacts from a dark stain in the south field. Clark's total collection from the site numbered 22 specimens.

Mrs. Stephenson reported that in the late 1950s or early 1960s several university students conducted "unsystematic" investigations along the fence row. The identity or affiliation of these students and the disposition of their collection is unknown.

As part of his Metro Study, Victor Konrad interviewed the McNair family in 1972, and registered the site in Lot 25, as a Terminal Woodland village comprising 6-10 acres with an Archaic component, based on the presence of some Early Archaic Nettling points in the family's collection. Konrad reported that the McNair's collection consisted of approximately 300 pieces (1973:128). Approximately 160 of these artifacts are now in the Black Creek Pioneer Village. The Nettling material was likely derived from some other portion of the McNair's property, perhaps from the Edgar site, as no further evidence of an Early Archaic occupation was encountered during our work at McNair.

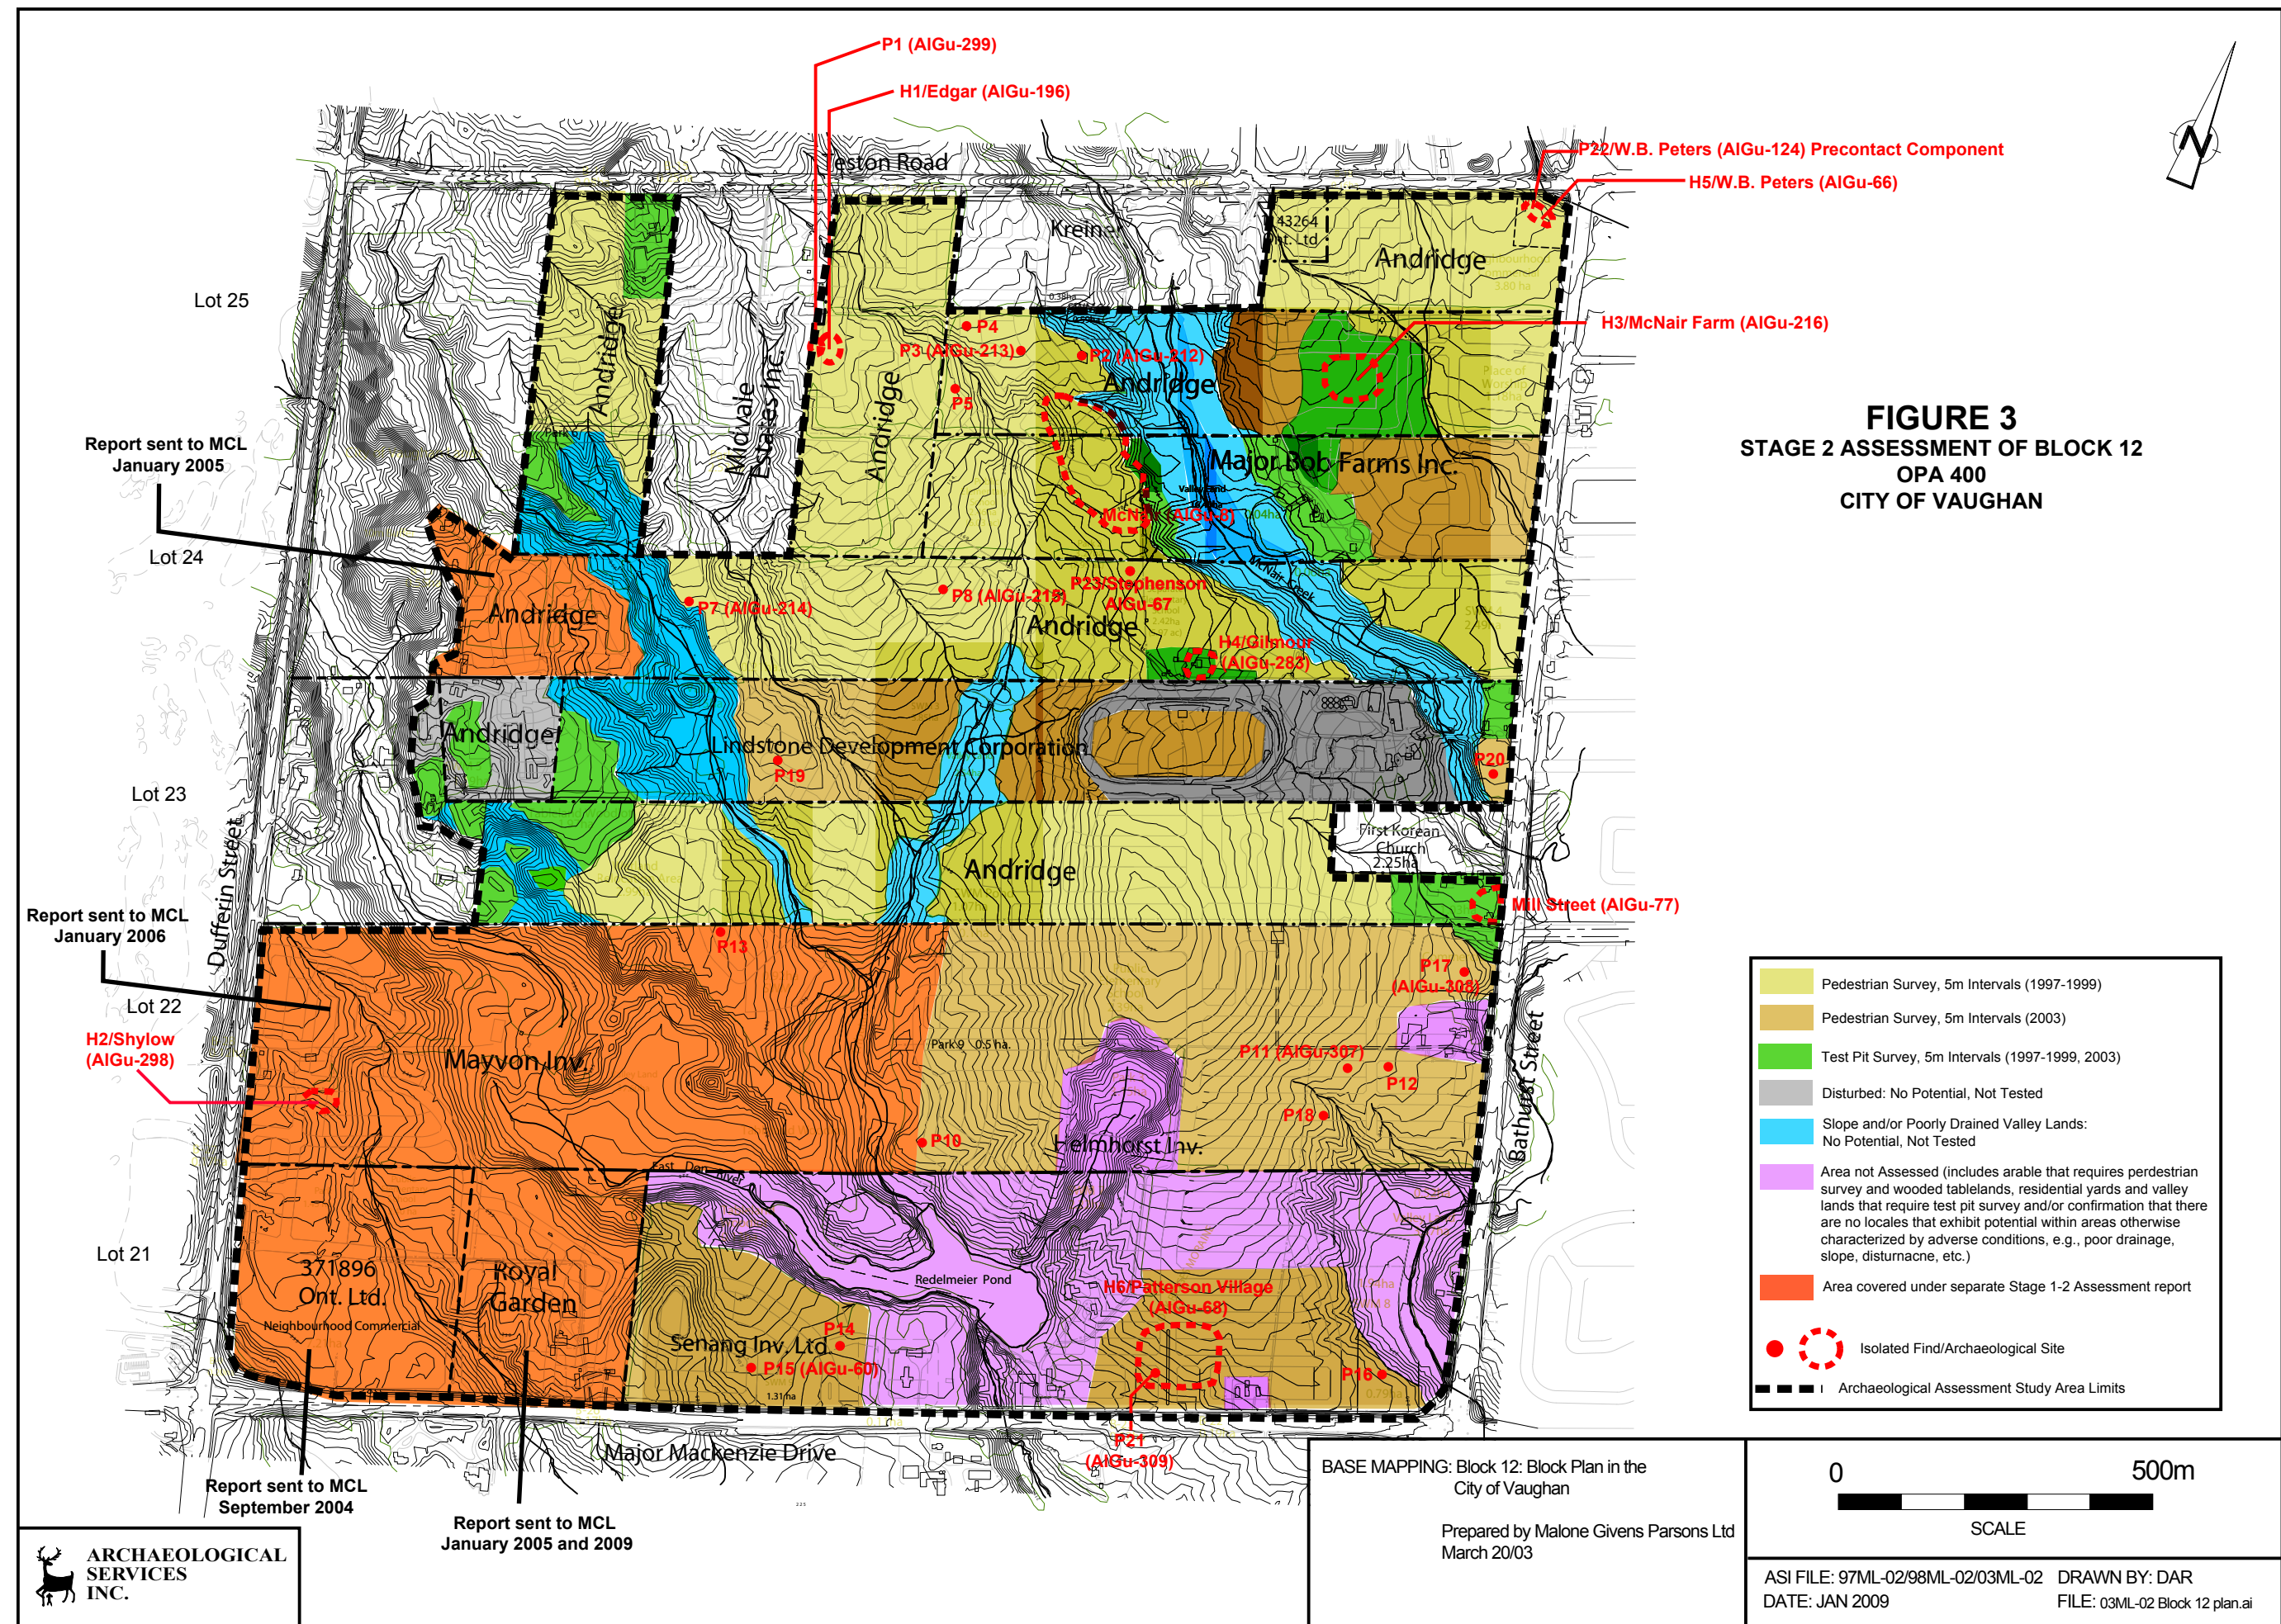

In 1987 Poulton relocated the site. Despite alfalfa cover, a surface scatter in the southern field was mapped, indicating heavier concentrations along the eastern margin of the high ground. Surface survey of the north hay field was unsuccessful. Fifteen test pits excavated in the fence row and in the north hay field produced few artifacts. In all, 65 specimens were collected by Poulton. Based on his investigations, Poulton was able to correct Konrad's site location and characterization. Although field conditions did not allow determination of the exact limits of the site or location of middens, the site appeared to be considerably smaller than Konrad's estimation of 6-10 acres. The site, situated on tableland on the west side of the valley of McNair Creek, comprises an area of approximately 1.0 hectare (MPP 1987:86).

The **Stephenson site** (AlGu-67) was identified during the Archaeological Master Plan survey. The site consisted of an isolated chert flake. It was situated on the east half of Lot 24, a short distance to the south of the McNair site.

Given the results of the Stage 1 assessment, a Stage 2 survey of the Block 12 lands was recommended. The Stage 2 archaeological assessment of the Andridge Homes Limited and Major Bob Farms Inc. lands was conducted via a systematic test pit and pedestrian survey conducted at five metre intervals (ASI 2010). The northern portion of the McNair site was documented in August of 1998. The site extended across the southeastern portion of Lot 25 (Andridge Homes Limited) into the northern portion of Lot 24 (Major Bob Farms Inc.). An extensive midden deposit was encountered along the fence line marking the boundary between Lots 24 and 25.

Two precontact isolated finds and two additional sites, Site AlGu-212 and AlGu-213, were encountered on level terrain to the west of a tributary of McNair Creek within the Andridge Homes Limited lands approximately 100 meters north of the McNair site (Figure 3, ASI 2010). Site AlGu-212 consisted of four Onondaga chert flakes recovered from an area of approximately 30 square metres while Site AlGu-213 consisted of two flakes, two pieces of shatter, and a biface fragment, distributed over an area of approximately 200 square metres. Given the number of artifacts recovered from these locales, their relatively focussed distribution, and close proximity to the McNair site, they were recommended for further investigation in order to determine if these sites were related to the McNair settlement.

1.3 1998 Stage 3 Investigations

Given the apparent richness of the McNair artifact scatter, a Stage 3 controlled surface collection of the site was conducted under the project management of Mr. Martin Cooper and field direction of Dr. Shaun Austin under archaeological consulting licence 1998-014 issued to Dr. Austin in accordance with the Ontario Heritage Act (1990). The area of positive finds was intensively walked at one to two metre intervals and all surface finds were flagged. A datum was established in the fence line to serve as the basis for the surface collection and a five metre grid (oriented to magnetic north) was established. In total, 562 artifacts were mapped using a transit and stadia rod and then collected, resulting in the preliminary definition of Midden 1 within the Andridge Homes Limited lands (Figure 4). The material recovered during this controlled surface collection included ceramic vessel sherds including analyzable rims, ceramic smoking pipe fragments and juvenile analyzable rims, a ground stone metate, chert debitage and worked bone and shell artifacts. A complete catalogue of the artifacts collected during the 1998 visit is presented in Appendix A.

1.4 1999 Stage 3 Investigations

In October of 1999, the Lot 24 (Major Bob Farms Inc.) portion of the site was investigated. A Stage 3 controlled surface collection of the site was conducted under the project management of Mr. Martin Cooper and field direction of Dr. Bruce Welsh under archaeological consulting licence 1999-007 issued to Dr. Welsh in accordance with the Ontario Heritage Act (1990). Field conditions were not optimal, but surface materials were collected from the eastern edge of the tablelands near the fence line and southeast of Midden 1. This material seemed to be located in the approximate location of Poulton's earlier surface finds and together these results resulted in the preliminary definition of Midden 2 although further investigation of this area determined that deposits were thin and represented an area of low-level refuse accumulation. A small number of additional items were recovered from disparate locations further to the south, indicating that the site extended further into Lot 24 (Major Bob Farms Inc.) than previously suspected. In total, 43 artifacts were mapped using a transit and stadia rod and then collected. Mapping is unavailable due to an error while recording the artifact coordinates. The material recovered during this controlled surface collection included ceramic vessel sherds including analyzable rims, an untyped projectile point base fragment and chert debitage. A catalogue of the artifacts collected during the 1999 visit is presented in Table 1.

Table 1: Artifact Catalogue from the 1999 Controlled Surface Collection

Cat. #	Qty	Artifact Class	Artifact Type	TA	Material	Comments
0.0066	1	Ceramics	RSH rim sherd			untyped, obliques opposed with dentate?

Figure 4: 1998 Controlled Surface Collection of Midden 1 at the McNair Site (AIGu-8)

Given the 1998 and 1999 investigation results, it was clear the McNair site represented a major settlement dating to the Late Iroquoian period, and was perhaps 0.8-1.0 hectares in size. The site had been largely plough-disturbed, except along the fence line between Lots 24 and 25 where intact deposits were still extant.

1.5 2003 Stage 3 Investigations

In July of 2003, Mr. Robert Pihl conducted a controlled surface collection at five metre intervals over the entire site; field conditions were excellent. Both fields in which the site was located had been ploughed and allowed to weather for the purposes of completing a controlled surface collection. The Stage 3 controlled surface collection was conducted under the project management of Dr. Ronald Williamson and under the field direction of Mr. Robert Pihl and Mr. David Robertson under archaeological licences P057-016 and P050-032 issued to Mr. Pihl and Mr. Robertson, respectively, in accordance with the Ontario Heritage Act (1990). Although the artifact distribution was concentrated near the fence line in the area considered to be the site core, a light scatter extended to the southwest, thus confirming that the site extended to within 25 metres of the south margin of the Major Bob Farm Inc. lands (Lot 24). A site datum (grid reference 500-200/UTM 17T 0622451 4859491 [NAD83]) was established and tied into existing landmarks and property lines, and the locations of the surface artifacts were recorded relative to the datum by transit and tape (Plate 1). A total of 1,398 artifacts was collected.

Plate 1: Controlled Surface Collection of Midden 1 in 2003

In order to further define the nature of the midden to the north of the Lot 24-25 fence line (Midden 1) and low-level refuse area to the south of the Lot 24-25 fence line (Midden 2), a five-metre grid was extended over the entire site and a series of one metre square test units were excavated in each midden. All soils were screened, and profiles and floors examined for the presence of undisturbed cultural strata and/or subsurface settlement patterns in the form of features or post moulds.

Midden 1, despite being plough-disturbed, was quite productive and extensive (Plate 2, Figure 5 and 7). Soils were variable. The plough zone ranged from 18 to 29 cm in depth with basal midden deposits in the fencerow units varying from nil to 38 cm from the ground surface. Soils varying from loamy clay to organic and dark loam with ash matrices were screened through six millimetre mesh. Based on an artifact cut-off of approximately 50 analysable artifacts, Midden 1 was estimated to cover a 300 – 400 metre square area. A sizable portion of this midden was within the fence line. Midden 1 was subject to block excavation by hand during the Stage 4 salvage excavations.

Plate 2: Stage 3 Test Unit excavation of Midden 1 in 2003

Midden 2 was much smaller and characterized by low yields (Plate 3, Figure 6 and 7). The plough zone averaged around 19 centimetres in depth, and soils were heavy clay. All soils were screened through six millimetre mesh. Recovered artifacts consisted of small fragments of ceramics, faunal bone, smoking pipes, and lithic artifacts. This area was subject to further excavation by hand during the Stage 4 salvage excavations but resulted in fewer artifacts.

Plate 3: Stage 3 Test Unit excavation of Midden 2 in 2003

Figure 7: The Estimated Extent of the McNair Site (AlGu-8) Based on the 1998-2003 Surface Investigations and Topography

1.6 2003-2004 Stage 4 Salvage Excavations

Upon the completion of the Stage 3 assessment, a Gradall equipped with a smooth bucket was employed to remove the plough zone from the site area (Plate 4), with the exception of the midden areas, which were hand-excavated in one metre square units, with all soils except those retained as flotation samples, being screened through six millimetre mesh. This work started in late August of 2003, with the excavation of a series of trenches across the site area as estimated on the basis of the surface distribution of artifacts. Throughout the 2003 and 2004 field seasons, the excavation area was expanded as necessary to fully expose the settlement patterns within the occupation area of the settlement. In these operations, the plough zone, consisting of roughly 30 cm of topsoil, was removed to reveal the subsoil and all potential features and post moulds were further examined through shovel-shining and trowelling. As conditions warranted, and as the soil dried out during exposure to sun and wind, water was used to increase the visibility of the features. An area of approximately 1.52 hectare was exposed in this manner.

Plate 4: Mechanical topsoil removal at the McNair site.

All settlement patterns were recorded by means of triangulation within the five metre grid established on the site during the Stage 3. Prior to triangulation, post moulds and features were further defined by trowelling, and square plans were drawn.

Features were recorded by triangulation to a centre point and feature plans and descriptions, contents, relationships, etc., were then recorded on pre-printed forms. Features were hand excavated, their fills being screened through six millimetre mesh, although the exact manner in which this was carried out depended upon their size and complexity. In all cases, they were sectioned along their central long axes, their profiles recorded and photographed, and the remaining fill removed and either screened or bagged for soil sample flotation. Larger or more complex features were sectioned and excavated in quadrants to

provide the most useful vertical profiles for evaluating the nature of the feature. Profiles were both drawn and photographed for features, especially those with complex profiles.

The location and diameter of post moulds were recorded on pre-printed forms. They were sectioned when it was necessary to obtain a depth and orientation, and/or to distinguish between large support posts and small pits. Comments on fill and contents were recorded.

Artifacts recovered during feature and post excavations were bagged according to provenience. Flotation samples were taken from features in a variety of contexts from across the site.

The plough zone removal resulted in the documentation of eight house structures across the settlement area. Three major houses were found in the southern portion of the site: House 1, House 2, and House 4. Houses 2 and 4 were aligned roughly parallel to the crest of the ridge that defined the site, while House 1 at the south extreme of the site was oriented more or less across the ridge. Additional stripping to the south of House 1 did not uncover any additional settlement patterns that would indicate that the occupation area extended into Lot 23.

Five structures were found in the northern portion of the site. Both Houses 3 and 5 were small structures that possibly represented seasonal dwellings or special purpose buildings. House 5 was further associated with a series of fences or windbreaks. Houses 6 and 7/8 were more typical longhouses.

Numerous exterior activity areas were documented in the areas between the houses themselves and between the houses and the break-in-slopes defining the limits of the settlement area. In the case of the latter, every attempt was made to strip a minimum of ten metres beyond peripheral features where topography warranted.

Additional test trenches were excavated on the level summit of the knoll located approximately 30-50 metres to the north of the McNair site (Figure 8), in the area of Sites AlGu-212 and AlGu-213 to determine if these sites related to the McNair site as peripheral site activity areas. Site AlGu-212 consisted of four Onondaga chert flakes recovered from an area of approximately 30 square metres while Site AlGu-213 consisted of two flakes, two pieces of shatter, and a biface fragment, distributed over an area of approximately 200 square metres. It was determined that both sites represented ephemeral scatters of material associated with activity carried out just beyond the main McNair settlement area. No settlement patterns were noted and no additional artifacts were found within this area.

Further investigation of the Stephenson site (AlGu-67), located on the south side of the tree dividing Lot 24 in half, yielded no additional artifacts and no settlement patterns were noted (Figure 3). Given the size of the McNair site and the fact that only a single chert flake was recovered from this locale, and the tree line was test pitted during the Stage 2 assessment without any additional finds, this artifact simply represents an outlier of the McNair surface scatter.

Ninety-two features were documented in association with the houses. One midden (Midden 1) was located in north of the tree line within the Andridge Homes Limited lands and one midden (Midden 2) was located to the south of the tree line within the Major Bob Farms Inc. lands. From these subsurface features, plough zone test units, and the excavation of the middens in one-metre units, 63,280 ceramic artifacts, 7,314 flaked lithic artifacts, 29 ground stone artifacts, 3,971 worked and unmodified animal bones were recovered. The flotation of 75 litres of soil from various contexts across the site yielded a variety of floral remains.

2.0 SETTLEMENT PATTERNS

Bruce Welsh and Christopher Watts

2.1 Introduction

As noted in Section 1.0, the 2003-2004 excavations at McNair resulted in the documentation of a 1.0 hectare Late Iroquoian village consisting of two midden deposits, 10 activity areas and as many as eight longhouses (Figure 8). Three of these longhouses, Houses 1, 2 and 4, were found within the southern reaches of the site and are set off from one another by distances of 20 to 25 metres. The five remaining longhouses, Houses 3, 5, 6, 7 and 8, are more closely concentrated at the northern end of the site, with Houses 3, 5 and 6 being situated less than 10 metres apart and House 7 overlapping House 8. When combined with the open area separating these two loci (Figure 8), it is clear the McNair site covered an extensive area. The reasoning behind this arrangement is unclear. The knoll on which the site is situated is sizeable and relatively flat, and so it may be that the McNair site occupants felt there was no need to concentrate their houses in any one place. As discussed in Section 9.0, it may also be that changes in the settlement system, brought about over time by decreases in seasonal mobility, resulted in a more intensive occupation of the northern half of the site.

A number of house orientations are present at the McNair site (Figure 8 and Table 2) although three trends may be discerned. House 1 has a north-northeast, south-southwest orientation; Houses 2, 3 and 4 are oriented in a north-northwest, south-southeast direction, while Houses 5, 6, 7 and 8 are generally oriented in a northwest-southeast manner. Given the contours of the knoll, the orientation of Houses 5, 6, 7 and 8 makes more efficient use of level land in the northern portion of the site. Within the wider areas of level land in the southern extent of the site, House 4 was apparently erected along the long axis of the knoll, while Houses 1 and 2 were placed along the southeast and southwest edges of this landform, respectively.

Three longhouses (Houses 3, 4 and 8) at the McNair site are poorly defined. At roughly 14 metres in length, House 3 appears to be missing much of its southern extent although there is some indication along its east wall of a turn toward a south end segment (Figure 8). House 4, while sizeable, has several gaps in its east and west margins and is entirely missing its south end wall. At the north edge of the site, House 8 is missing most of the south half of its west end (Figure 8). Much of its east end is also ill defined, largely due to the presence and interference of a tree line separating Lots 24 and 25. Nevertheless, enough of the house wall posts remain to indicate that House 8 overlaps with House 7, with House 7 being rather better defined. Only two of the longhouses, Houses 6 and 7, display limited repair work.

The following section constitutes an analysis of the settlement features, providing both general observations and detailed descriptions. Metric attributes for each house are summarized in Table 2.

Table 2: McNair Site House Variability

House No.	Length (m)	Width (m)	Orientation (°E of N)	Area (m ²)
House 1	52.5	8.0	12.58	420
House 2	48.5	7.8	337	378
House 3	14	7.6	334	106
House 4	60	8.3	329	498
House 5	10/13	7.8	294	78/101.4
House 6	52/55/56	8.1	295	421.2/445.5/453.6
House 7/8	45	7.7	295	346.5

2.2 Structures

2.2.1 House 1

House 1 was located at the southeast edge of the settlement approximately 19 metres southeast of House 4 and 25 metres west of the break in slope overlooking the ravine and creek on the east side of the site. With an orientation of 12.58° east of north, House 1 measured 52.5 metres in length by 8.0 metres in width providing an enclosed area of approximately 420 square metres. Owing to a tightly rounded end wall, the north end of House 1 had a flattened appearance. The south end wall, however, appeared more diagonal than perpendicular to the long axis of the house resulting in an asymmetrical configuration (Figure 9).

The north end wall of House 1 appears to have had two doorways. One was situated at the gap between the west wall and the west edge of the north wall, while the other was found at the gap between the east wall and the east edge of the north wall (Figure 9). The south end wall looks to have a twin opening near its centre with a single post separating the two entrances. There were numerous other gaps along the east and west walls of House 1 which likely relate to documented, localized concentrations of heavy soils but may also point to deliberate construction practices (see discussion below). The walls of the house were formed primarily by paired and single row posts and there was little evidence of repair work.

The distribution of interior and support posts indicated the presence of a west bunk line and, less definitively, an east bunk line. The west bunk line was approximately 2.1 m in width while the east bunk line may also have been 2.1 m wide, providing a central corridor width of 3.8 m (Figure 9). The distribution of interior posts did not indicate the presence of demarcated storage cubicles at the ends of the house.

Fifteen features were encountered in House 1 (Table 3). The three features found within the west bunk line, Features 34, 40 and 52, were all refuse pits. Of the four features documented within the east bunk line, three were refuse pits (Features 37, 38 and 57) and one, Feature 29, was a hearth. Regarding the six features encountered within the central corridor, four were refuse pits (Features 26, 45, 47 and 53), and two (Features 20 and 33) were hearths. Two additional features, Features 14 and 46 were both refuse pits which straddled the east bunk line, making it difficult to define their precise location within either the bunk line or central corridor.

For a hearth, Feature 29 was rather oddly positioned in the southeast corner of the house near the east and south walls. Given the obvious dangers associated with the proximity of a hearth to combustible housing materials, Feature 29 is not likely to be contemporary with House 1.

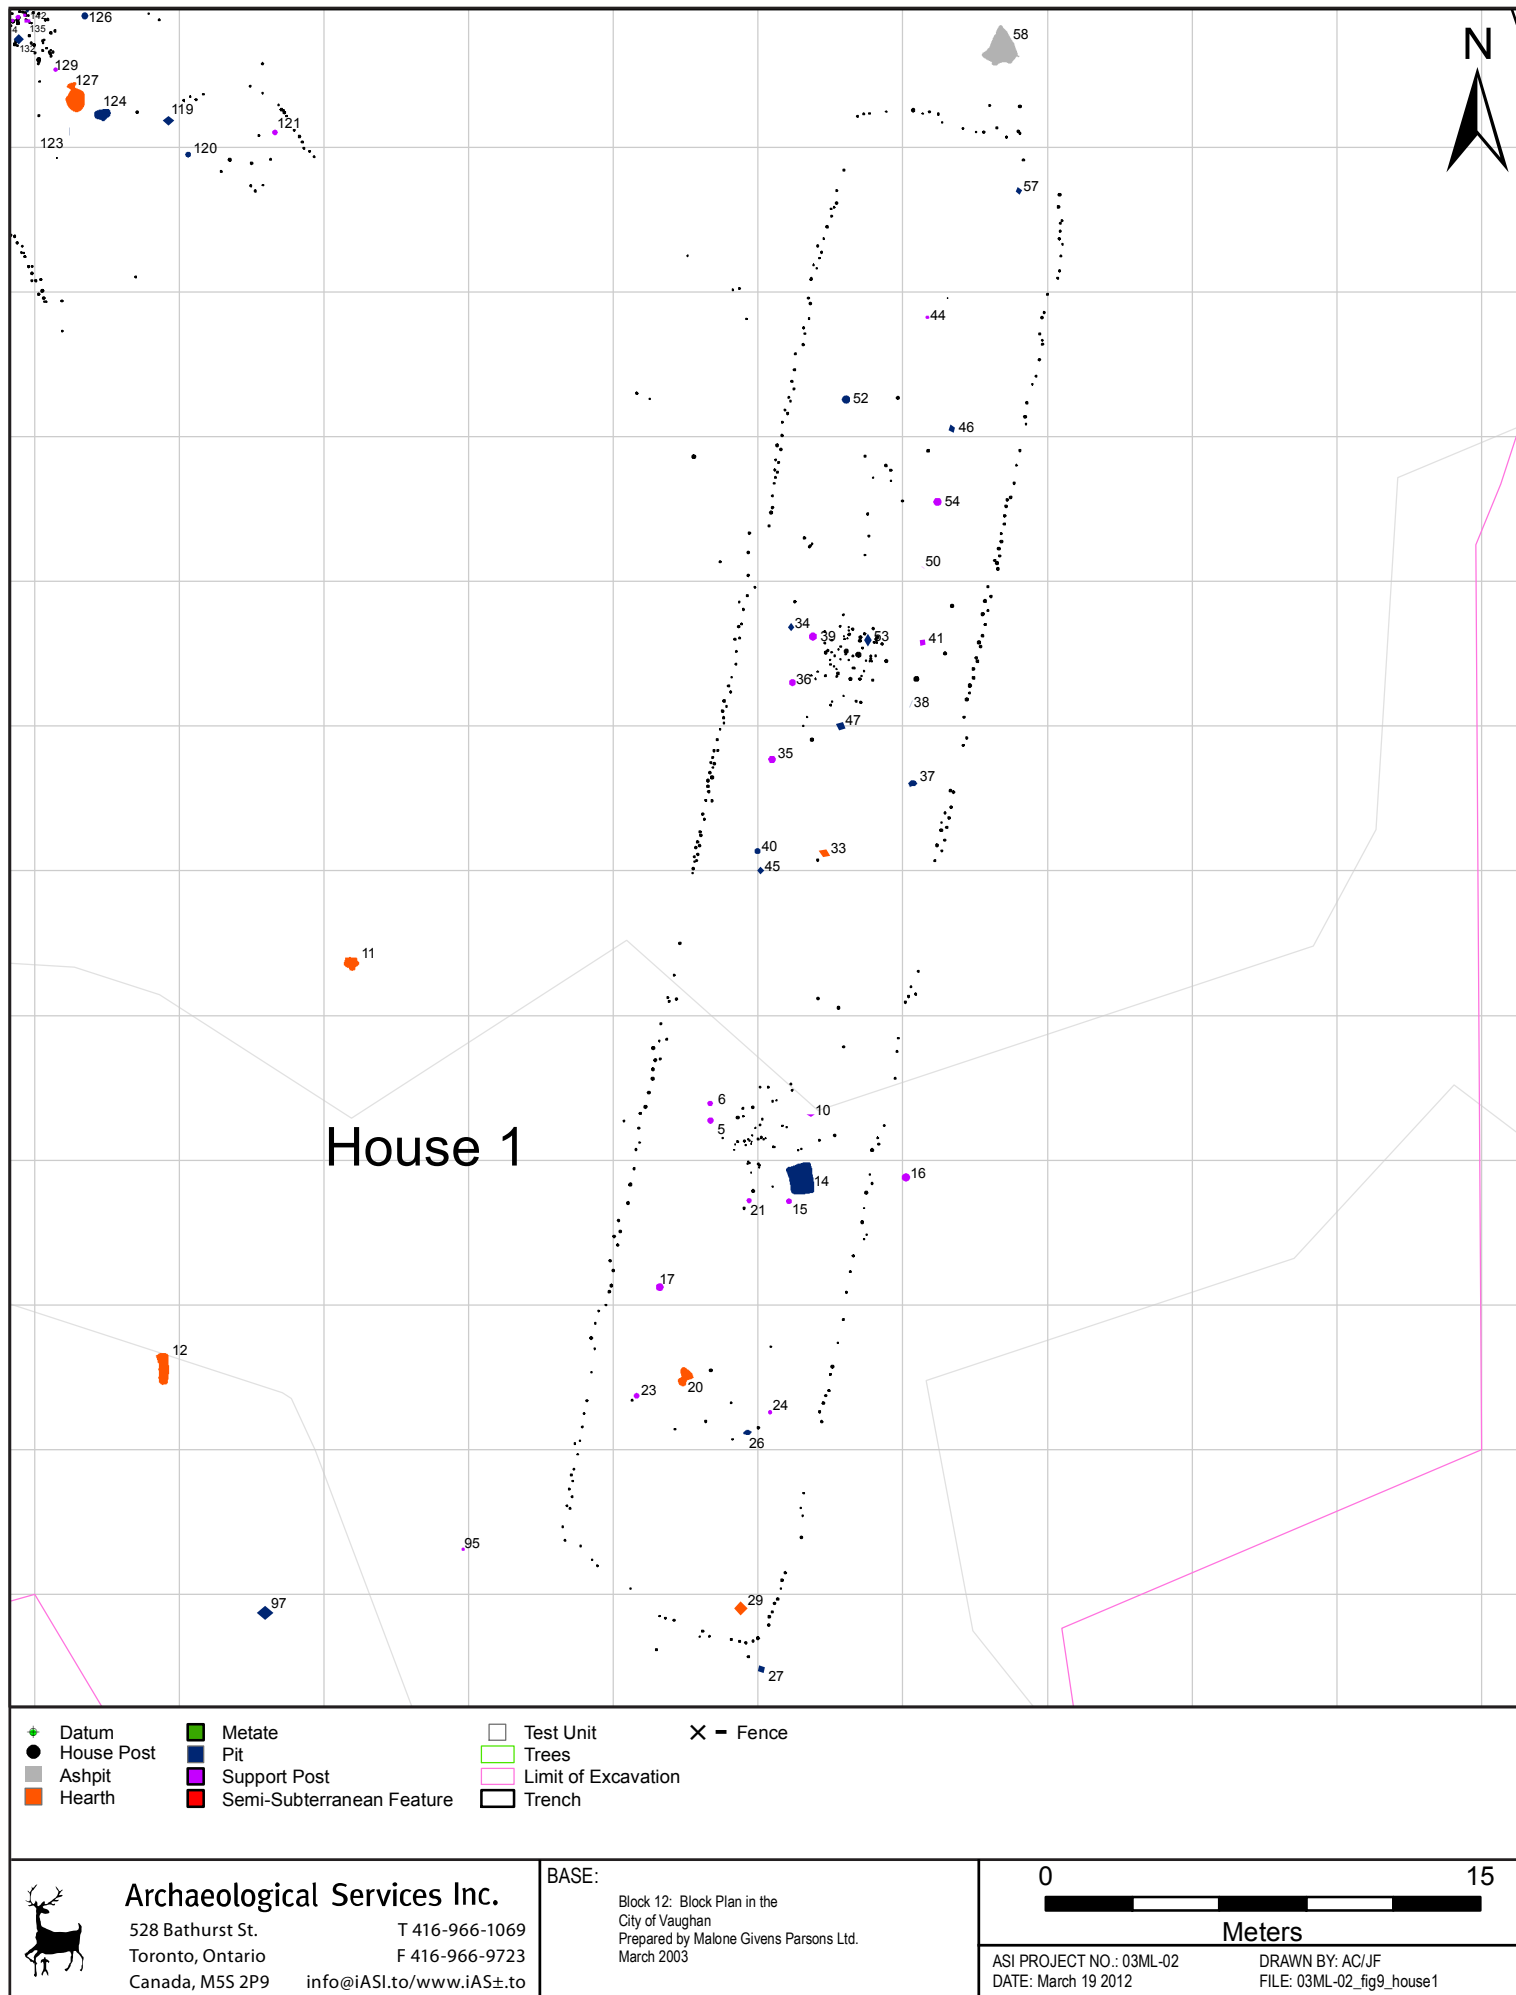

Figure 9: Planview of House 1

Table 3: House 1 Summary Description of Features

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Location	Contents. Fill Composition
14	Pit	107	80	14	Rectangular/Irregular	H1 Centre/East Bunk	Pottery. Fill: subsoil mottled with dark soil (10yr5/6 - dark yellowish brown)

2.2.2 House 2

House 2, with an orientation of 337° east of north, was situated at the southwest edge of the McNair settlement, adjacent to and virtually parallel with the top of bank overlooking the ravine and creek on the west side of the site (Figure 10 and Table 4).

Table 4: House 2 Summary Description of Features

89	Hearth	110	105	07	Ovate/Skewed	H2 Centre	Pottery. Fill: dark soil mottled with fired soil and subsoil (7.5yr5/6 - strong brown)

At 48.5 metres in length and 7.8 metres in width, House 2 provided an enclosed area of approximately 378 square metres. The shape of the House 2 north end wall was unusual; the west half appeared to be gently rounded while a bulge occurred where this section meets the east wall, with the east half of the end wall roughly forming a straight line (Figure 10). A small fence may have existed at the centre of the end wall, creating a 'bubble,' while a doorway would appear to have existed immediately west of this area. Construction practices associated with the south end wall also appeared somewhat haphazard, but this wall partly conformed to a more rounded appearance. An apparent doorway was found in the east half of the south end wall. The walls of the house were formed primarily by paired and single row posts and few additional posts that might reflect repair activity.

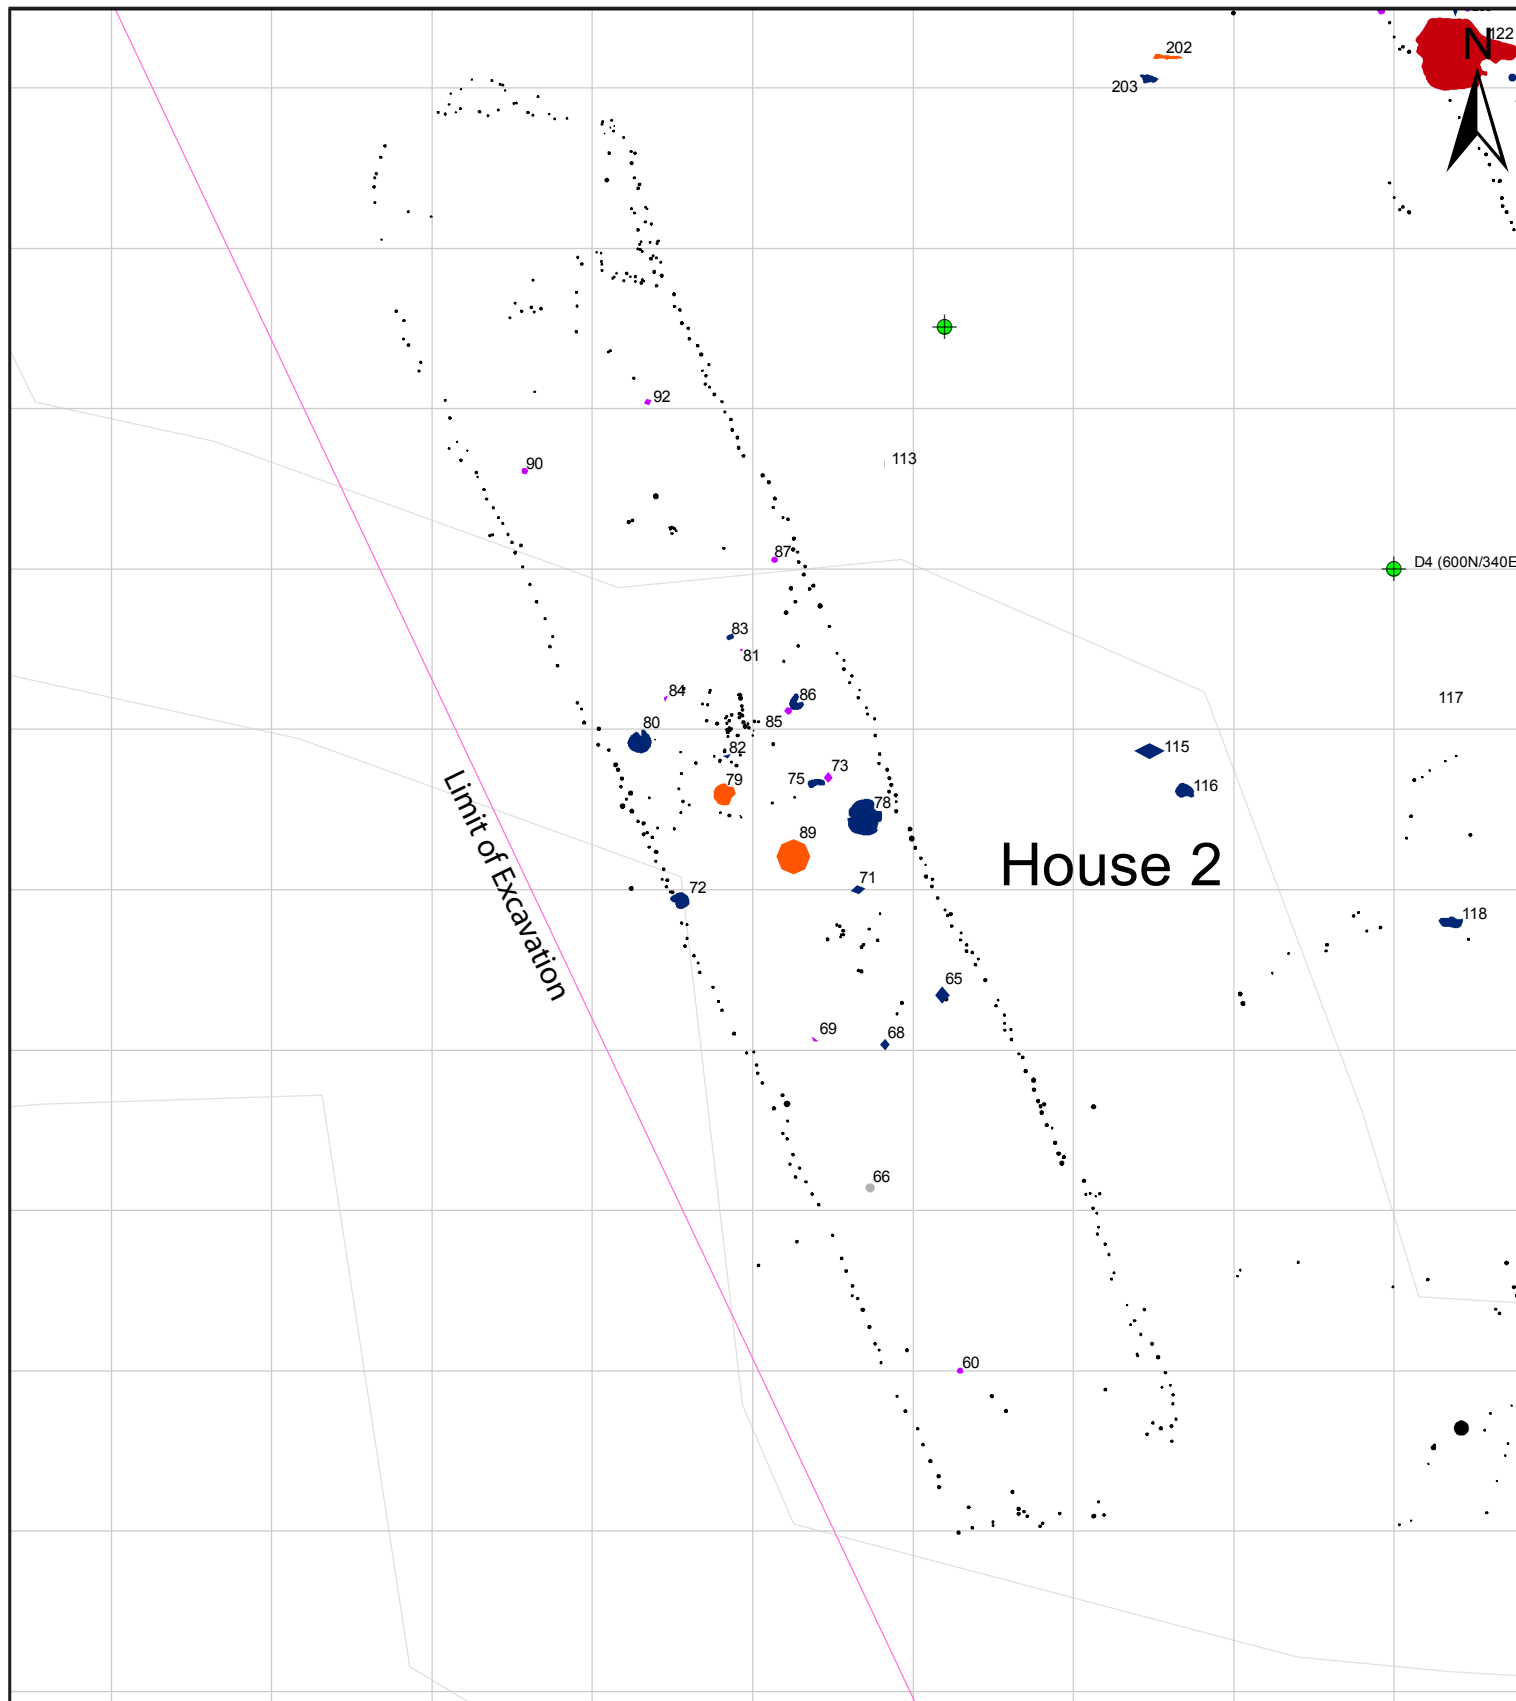

The distribution of interior support posts did not reveal the clear presence of bunk lines. Although support posts existed, they were either widely spaced (in the case of a possible west bunk line) or discontinuous, as with the possible east bunk line (Figure 10). If bunk lines did exist in this house, the east form was approximately 1.9 metres wide while the west structure was approximately 2.2 metres in width. This would have provided a central corridor with a width of 3.7 metres.

Of the 14 features encountered in House 2, seven were situated in the central corridor, three in the possible west bunk line, and four in the possible east bunk line (Figure 10). The three features situated in the west bunk line included Feature 66, as well as Features 72 and 80. Features 72 and 80 were both refuse pits, while Feature 66 was an ash pit. The four features situated in the east bunk line, Features 65, 78 and 86, all comprised refuse pits while Feature 87 was a support post albeit an oddly positioned one. The remaining seven features were situated within the House 2 central corridor. Five of these, Features 68, 71, 75, 82 and 83, consist of refuse pits, while Features 79 and 89 were hearths.

An unusual aspect of the House 2 settlement pattern is that, with the exception of Feature 66, all of the features were concentrated in the centre of the dwelling (Figure 10).

Figure 10: Plan View of House 2

2.2.3 House 3

Situated on level, high ground approximately 20 metres from the top of bank on the west side of the site and eight metres west of House 5, House 3 was oriented 334° east of north (Figure 11). As noted above, only 14 metres of the house was defined. A portion of the south end wall, or possibly a partition, may have extended inwards from the west side of the structure, and the beginning of a turn to an end wall may have occurred at the south end of the east wall. As well, the sides of this house were not well delineated given the gaps that exist in the west and north walls, although the gap in the north end wall may have been the result of the presence of a doorway. The delineated walls of House 3 consisted only of single row posts while just two support posts (Features 105 and 106) were encountered within the structure.

The generally poor definition of House 3, including the lack of features and interior posts, may be the result of at least five possible situations. Firstly, House 3 may not have been completed and never occupied. Secondly, it may be that the construction of House 3 was abandoned in favour of House 5, which was located only five metres to the east and shared a similar overall length, as well as an apparent partition wall and possible extension. Third, soil conditions around House 3 were generally poor and, together with extensive disturbance by animals, may have contributed to the absence of settlement patterns. Fourth, House 3 may have functioned as a warm weather shelter/activity area and finally House 3 may have functioned as a temporary structure occupied by an advance or visiting party.

2.2.4 House 4

Oriented 329° east of north, House 4 was located in the southern half of the site (Figure 12 and Table 5) approximately 25 metres northeast of House 2. As in the case of House 3, no south end wall was delineated. Soil conditions around the house were generally poor and likely contributed to the numerous gaps in the east and west walls which went unresolved despite vigorous shovel shining. Nevertheless, the exposed portion of House 4 measured 60 metres in length and 8.3 metres in width, making it the widest and longest of the McNair site structures.

The walls of House 4 were formed primarily by paired and single row posts with no area of increased density that might reflect repair activity. There were, however, numerous gaps along the walls that were likely a result of poor soil conditions rather than doorways. Two doorways were thought to exist at the north end of the house. The first was situated in the west half of the north end wall, with two rows of posts that extended diagonally into the house forming a vestibule (Figure 12). The second and larger doorway appeared to exist at the northeast edge of the east wall. At this gap, a line of posts extended into the house and possibly intersected with the two rows of posts extending from the aforementioned northwest doorway, as well as a third line of posts that may have created another vestibule. In other words, both doorways appear to have had a screen or secondary door separating this area from the interior of the house. Two wall trenches, comprising Features 198 and 199, were encountered in the central section of the west wall (Figure 12 and Table 5).

The distribution of interior support posts does not reveal the clear presence of any bunk lines. Although support posts existed, they were either widely spaced and discontinuous as with a possible west bunk line, or discontinuous, widely spaced and not aligned, as with the possible east bunk line. However, if bunk lines did exist, they were approximately 2.1 metres wide providing the central corridor with a width of 4.1 metres.

Including the two wall trenches, a total of 34 features was encountered in House 4 (Table 5). Eighteen of these features were encountered within the central corridor and included 13 refuse pits; Features 123, 124, 126, 132, 141, 153, 155, 168, 170, 178, 185, 187 and 191; three hearths, Features 127, 137 and 179; one ash pit (Feature 156), and one glacial boulder utilized as a metate (Feature 183; Plate 5).

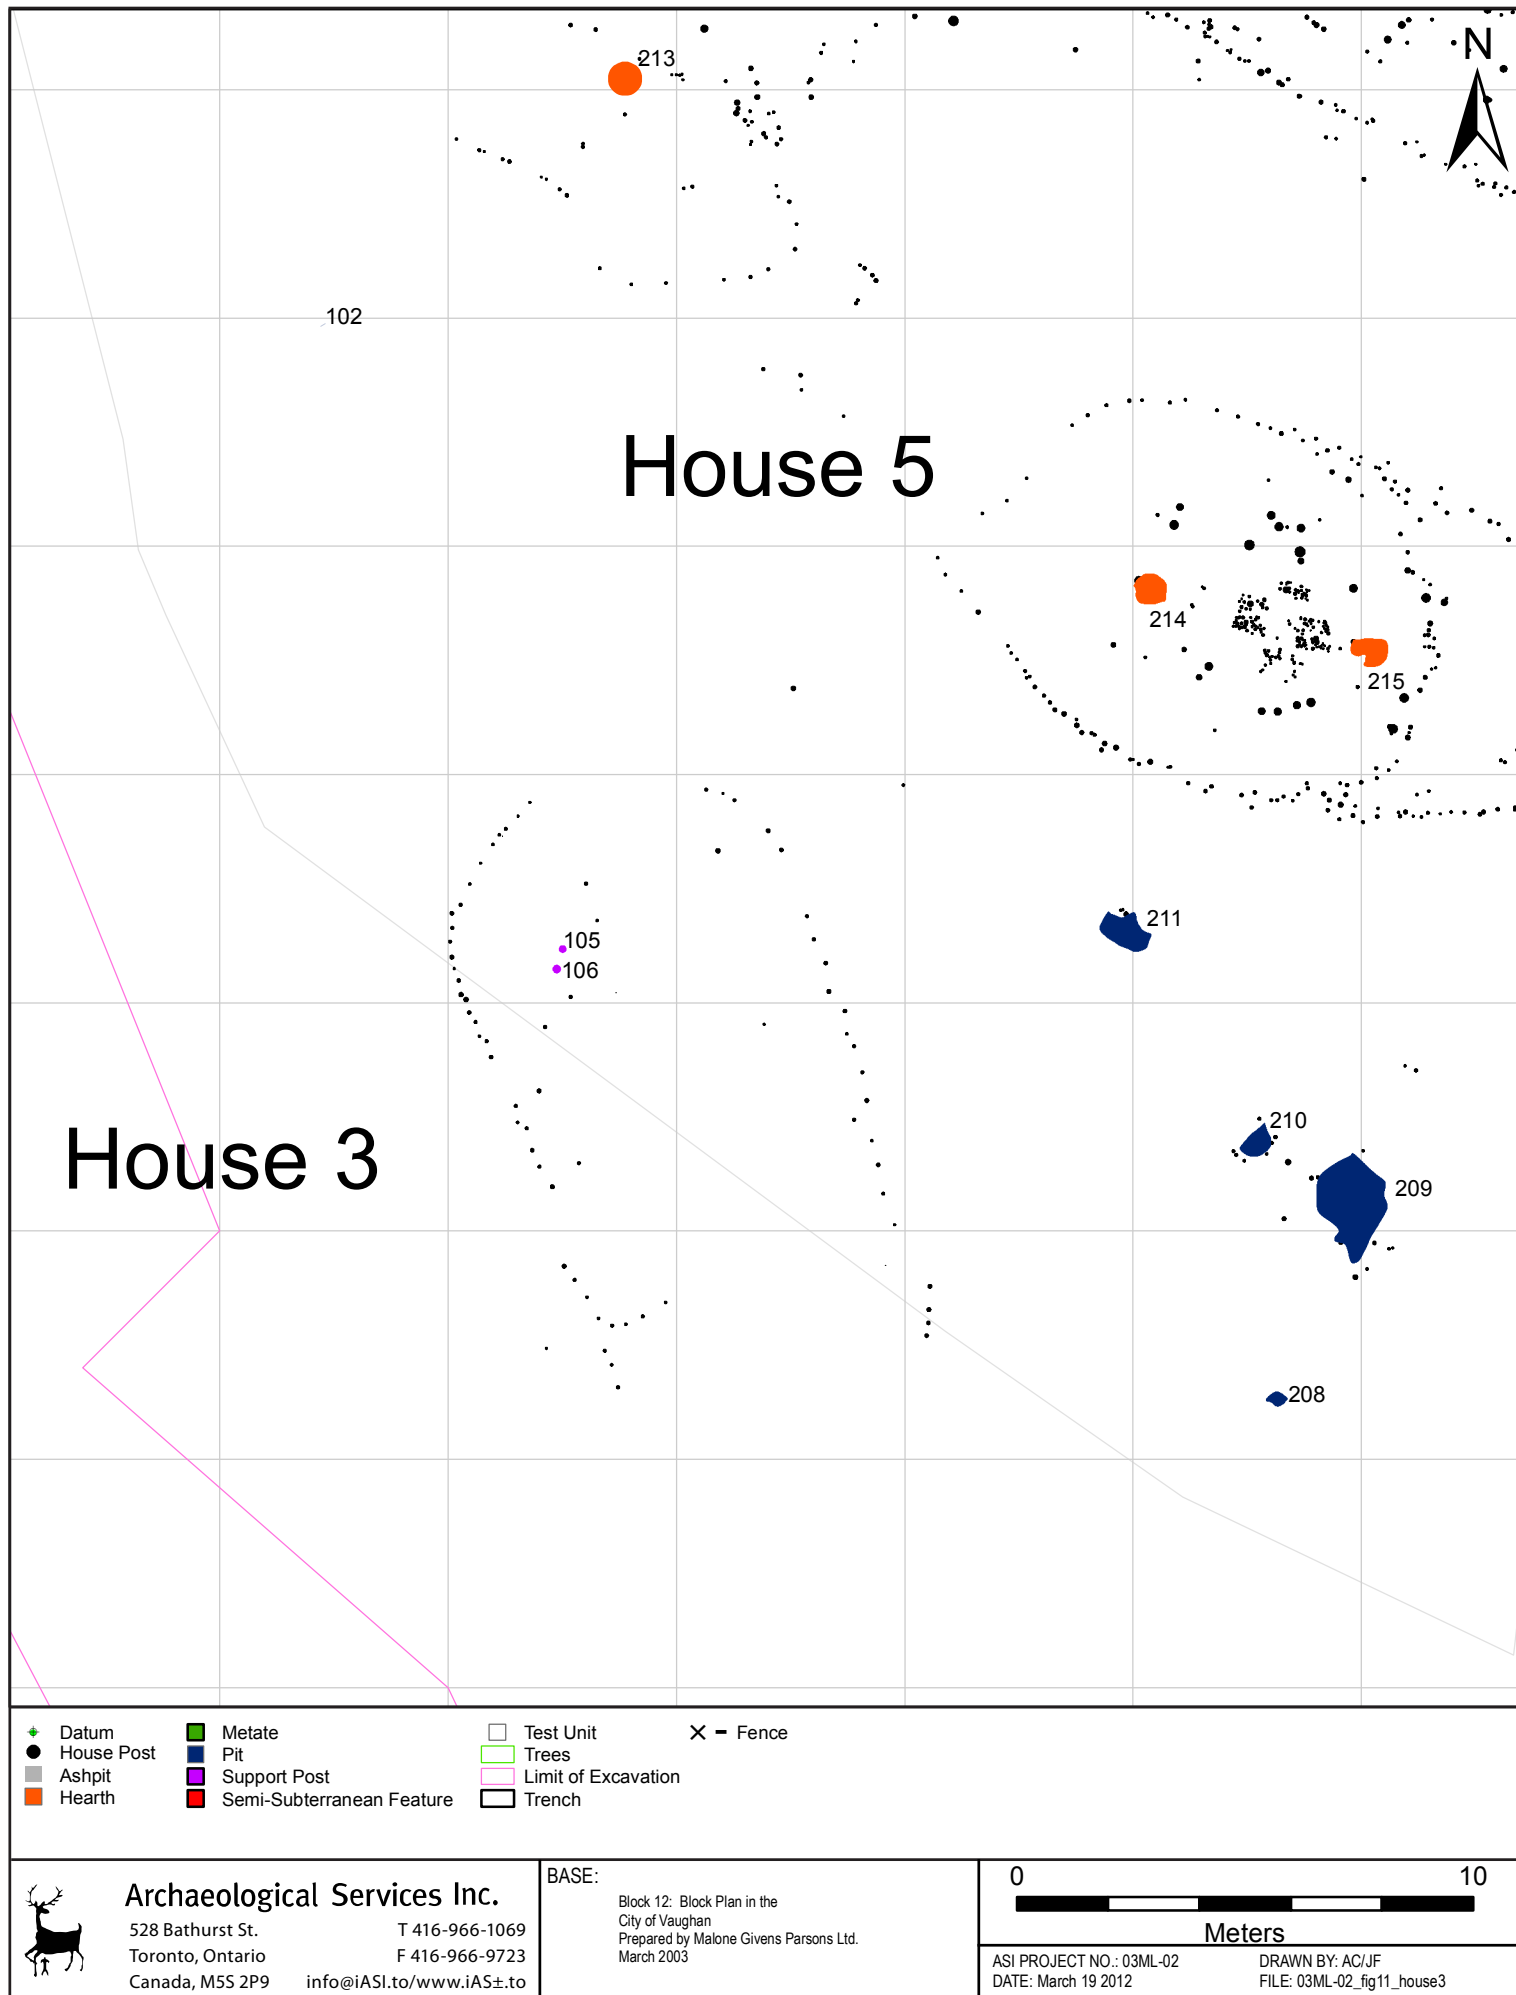

Figure 11: Plan View of House 3

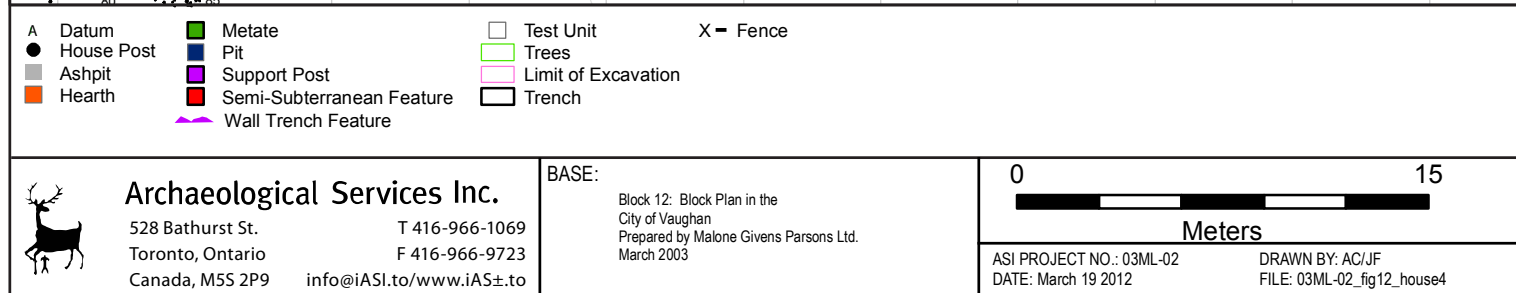

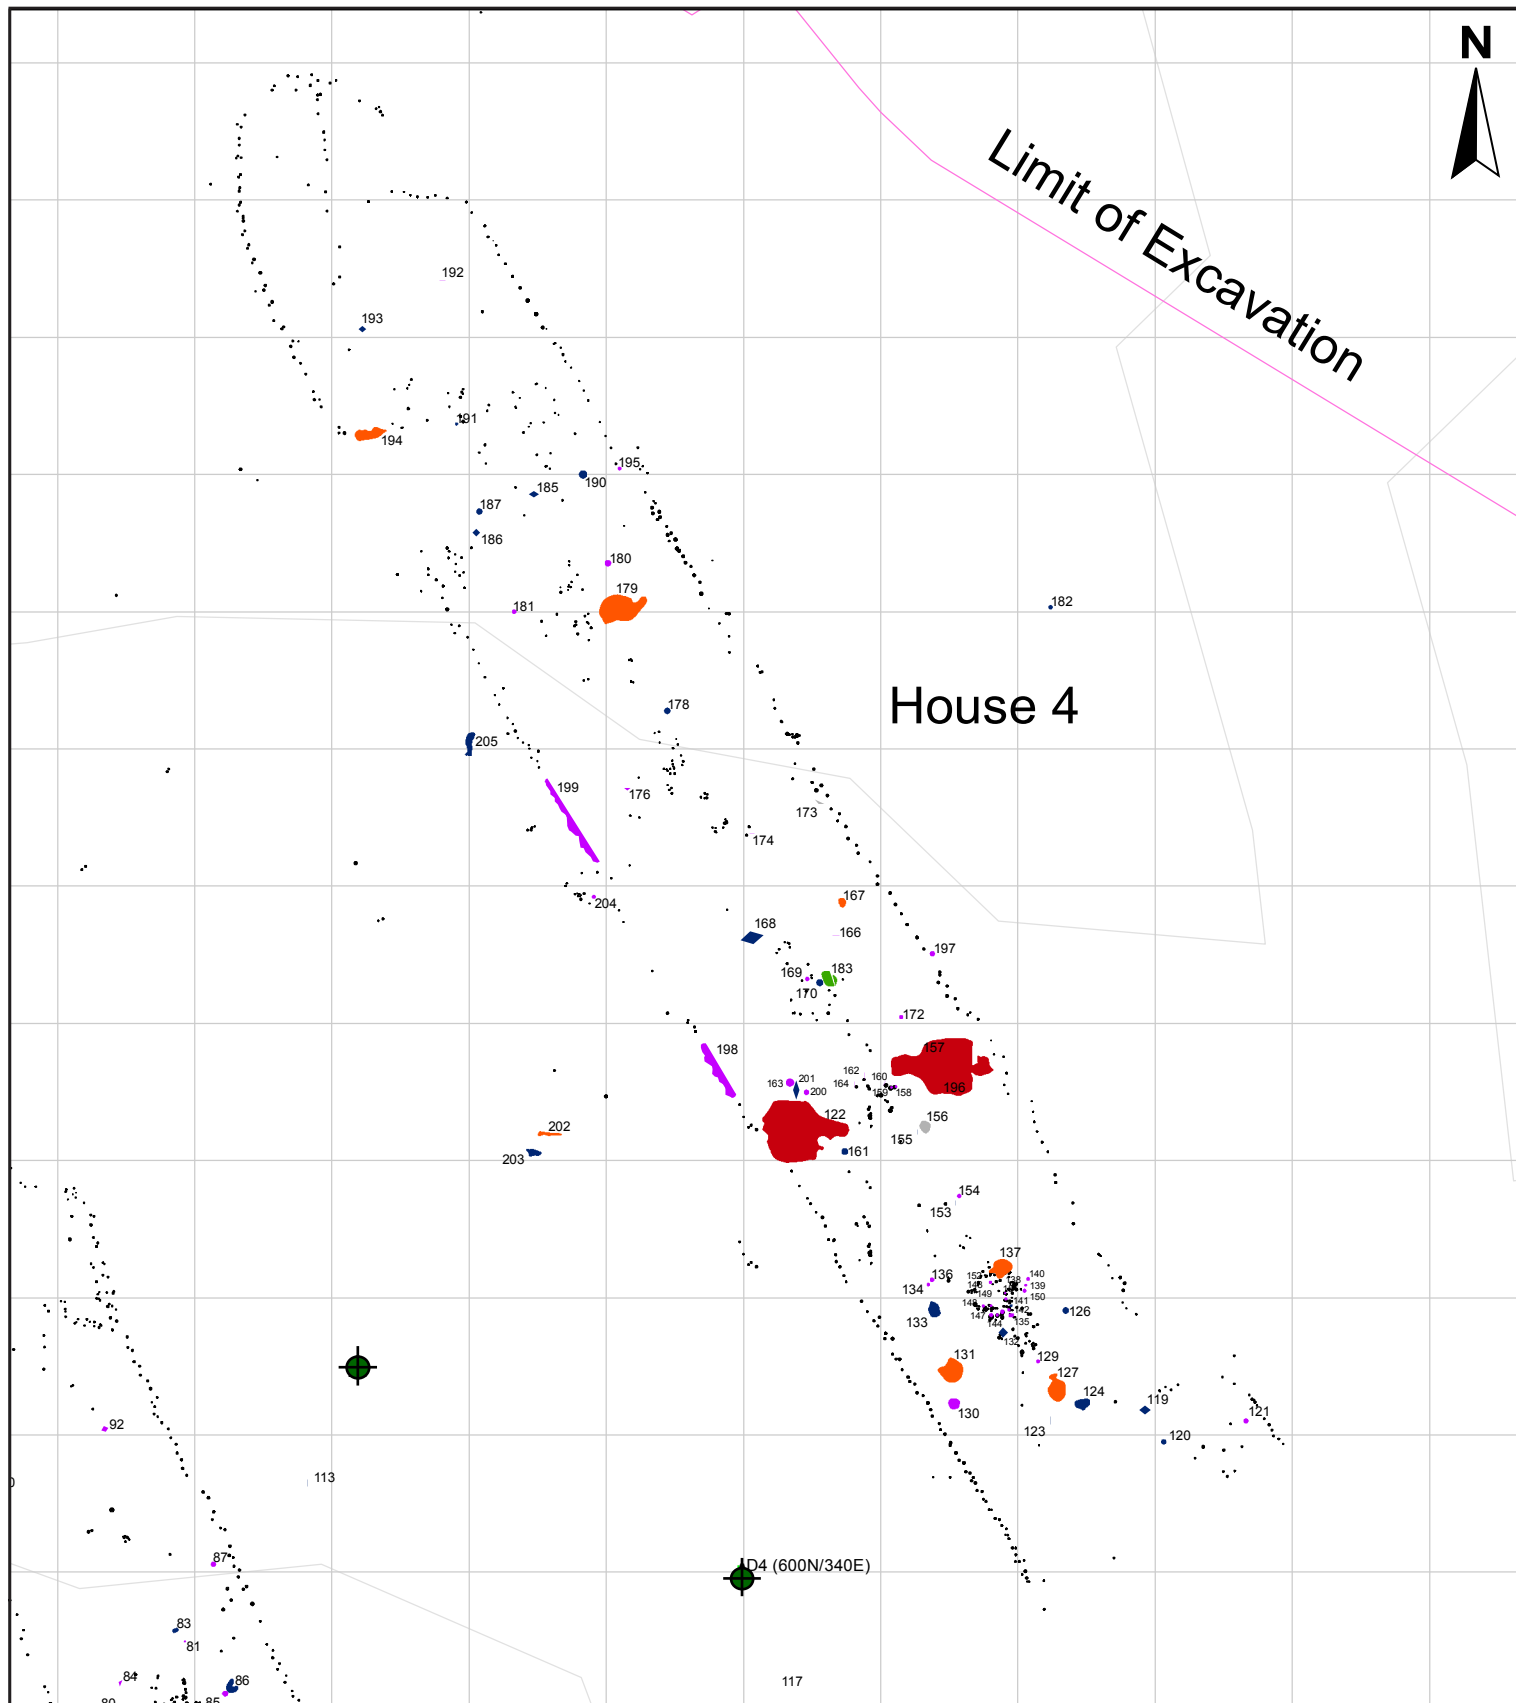

Figure 12: Plan View of House 4

The seven features encountered within the probable west bunk line included five refuse pits, Features 133, 161, 193, 194 and 201, one hearth (Feature 131), and one semi-subterranean sweat lodge (Feature 122). Feature 122 was oriented perpendicular to the long axis of the house with its ramp end and entrance situated within the central corridor, facing east (Figure 12). Although the west edge of Feature 122 appeared to impact the house wall, no wall posts were encountered in or beneath the feature. Therefore, it is possible that the sweat lodge end wall was incorporated into and used as part of the west wall of the house. Feature 122, with its symmetrical keyhole plan and regular flat bottom profile, measured 3.15 metres in length, 2.25 metres in width and 54 centimetres in depth (Figure 13). Both pottery sherds and fire-cracked rock (FCR) were recovered from the sweat lodge.

201	Pit	70	23	05	Ovate/ Shallow Basin	H4 West Bunk	Pottery. Fill: dark soil mottled with charcoal and subsoil (10yr3/2 - very dark greyish brown)

The seven features located within the probable east bunk line included four refuse pits, Features 119, 120, 157 and 190, one ash pit (Feature 173), one hearth, (Feature 167) and one semi-subterranean sweat lodge (Feature 196). Feature 196 was situated across from, and was virtually a mirror image of, Feature 122 (Figure 12). It was oriented perpendicular to the long axis of House 4 with the ramp end and entrance facing west. Like Feature 122, the ramp entrance was actually situated within the central corridor while the main body of the feature was situated within the east bunk line. The east end of Feature 196 does not, however, appear to impact the east wall

of the house. Feature 196 had a symmetrical keyhole plan and a flat bottom profile, although the living floor was not completely defined in all profiles. It measured 2.84 metres in length, 2.02 metres in width and 47 centimetres in depth. Pottery, bone, a pipe bowl and FCR were recovered from the feature.

The distribution of the House 4 features indicates three areas of concentration. The first centred around the three hearths, Features 127, 131 and 137, located at the south end of the house; the second consisted of features oriented to the two sweat lodges, Features 122 and 196, and the third consisted of a more dispersed group of features in the north half of the house.

Figure 13: Plan and Profiles of Feature 122 in House 4 at the McNair site (AIGu-8)

2.2.5 House 5

Located near the centre of the knoll and oriented 294⁰ east of north, House 5 was approximately eight metres east of House 3 and 25 metres northwest of House 4 (Figure 14). Possibly used for special purposes (see below), this short structure appeared to have been extended once during its use life. As a hearth (Feature 215) was situated at the east end of the building in close proximity to the end wall, the structure may have been extended as a precaution. Alternatively, as no posts or features were encountered within the extension, this area could have been used as a storage cubicle. This seems unlikely, however, as the extension appeared to articulate with an oddly shaped series of fence rows that defined additional spaces to the east of the structure. A gap in the south part of the extension appeared to lead into these spaces, whereas no gaps occurred within the end wall separating the original house from the addition. Thus, the House 5 extension that may have been built to accommodate the placement of Feature 215 may also have defined an area closely associated with the fenced off spaces on the east side of the structure. Given its enclosed nature, this extension and fenced area may have formed a separate activity area or portico associated with the house. Therefore, with a width of 7.8 metres, enclosed areas of 78 square metres and 101 square metres were associated with the original building and the extended version, respectively. Both eastern end walls appear gently rounded with a doorway on the south half of the extension wall leading into the fenced exterior activity area. No doorway appeared to exist in the inner east end wall. The west end wall may have had twin opening although it was not as well defined. The walls of House 5 were formed primarily by paired and single row posts with little evidence of any repair work (Figure 14).

Only two features were encountered in House 5, Features 214 and 215, both of which were hearths. Feature 214 was ovate in plan, measuring 73 centimetres in length and 67 centimetres in width, with a shallow (seven centimetre deep) basin shaped profile. Fills consisted of subsoil mottled with fired and dark soils (5yr4/6 - yellowish red). Feature 215 was irregularly shaped in both plan and profile view and measured 84 centimetres long, 52 centimetres wide and 13 centimetres deep. Like Feature 214, fills consisted of subsoil mottled with fired soil and dark soil (5yr4/6 - yellowish red). Interestingly, although these hearths were only separated by a distance of five metres, some 200 posts arranged in at least three clusters were found in the interstice. Additionally, a ring of support posts appears to have enclosed these clusters and may have served to connect one hearth to another (Figure 14). It therefore seems possible that House 5 was a special purpose construction. The association of hearths with the post clusters and ring of support posts may point to the presence of an above ground sweat lodge or structure associated with activities such smoking, curing or drying foods and other products (e.g., tobacco or hides). Moreover, the extension and fenced enclosures at the east end of the house may have been related to these or other activities.

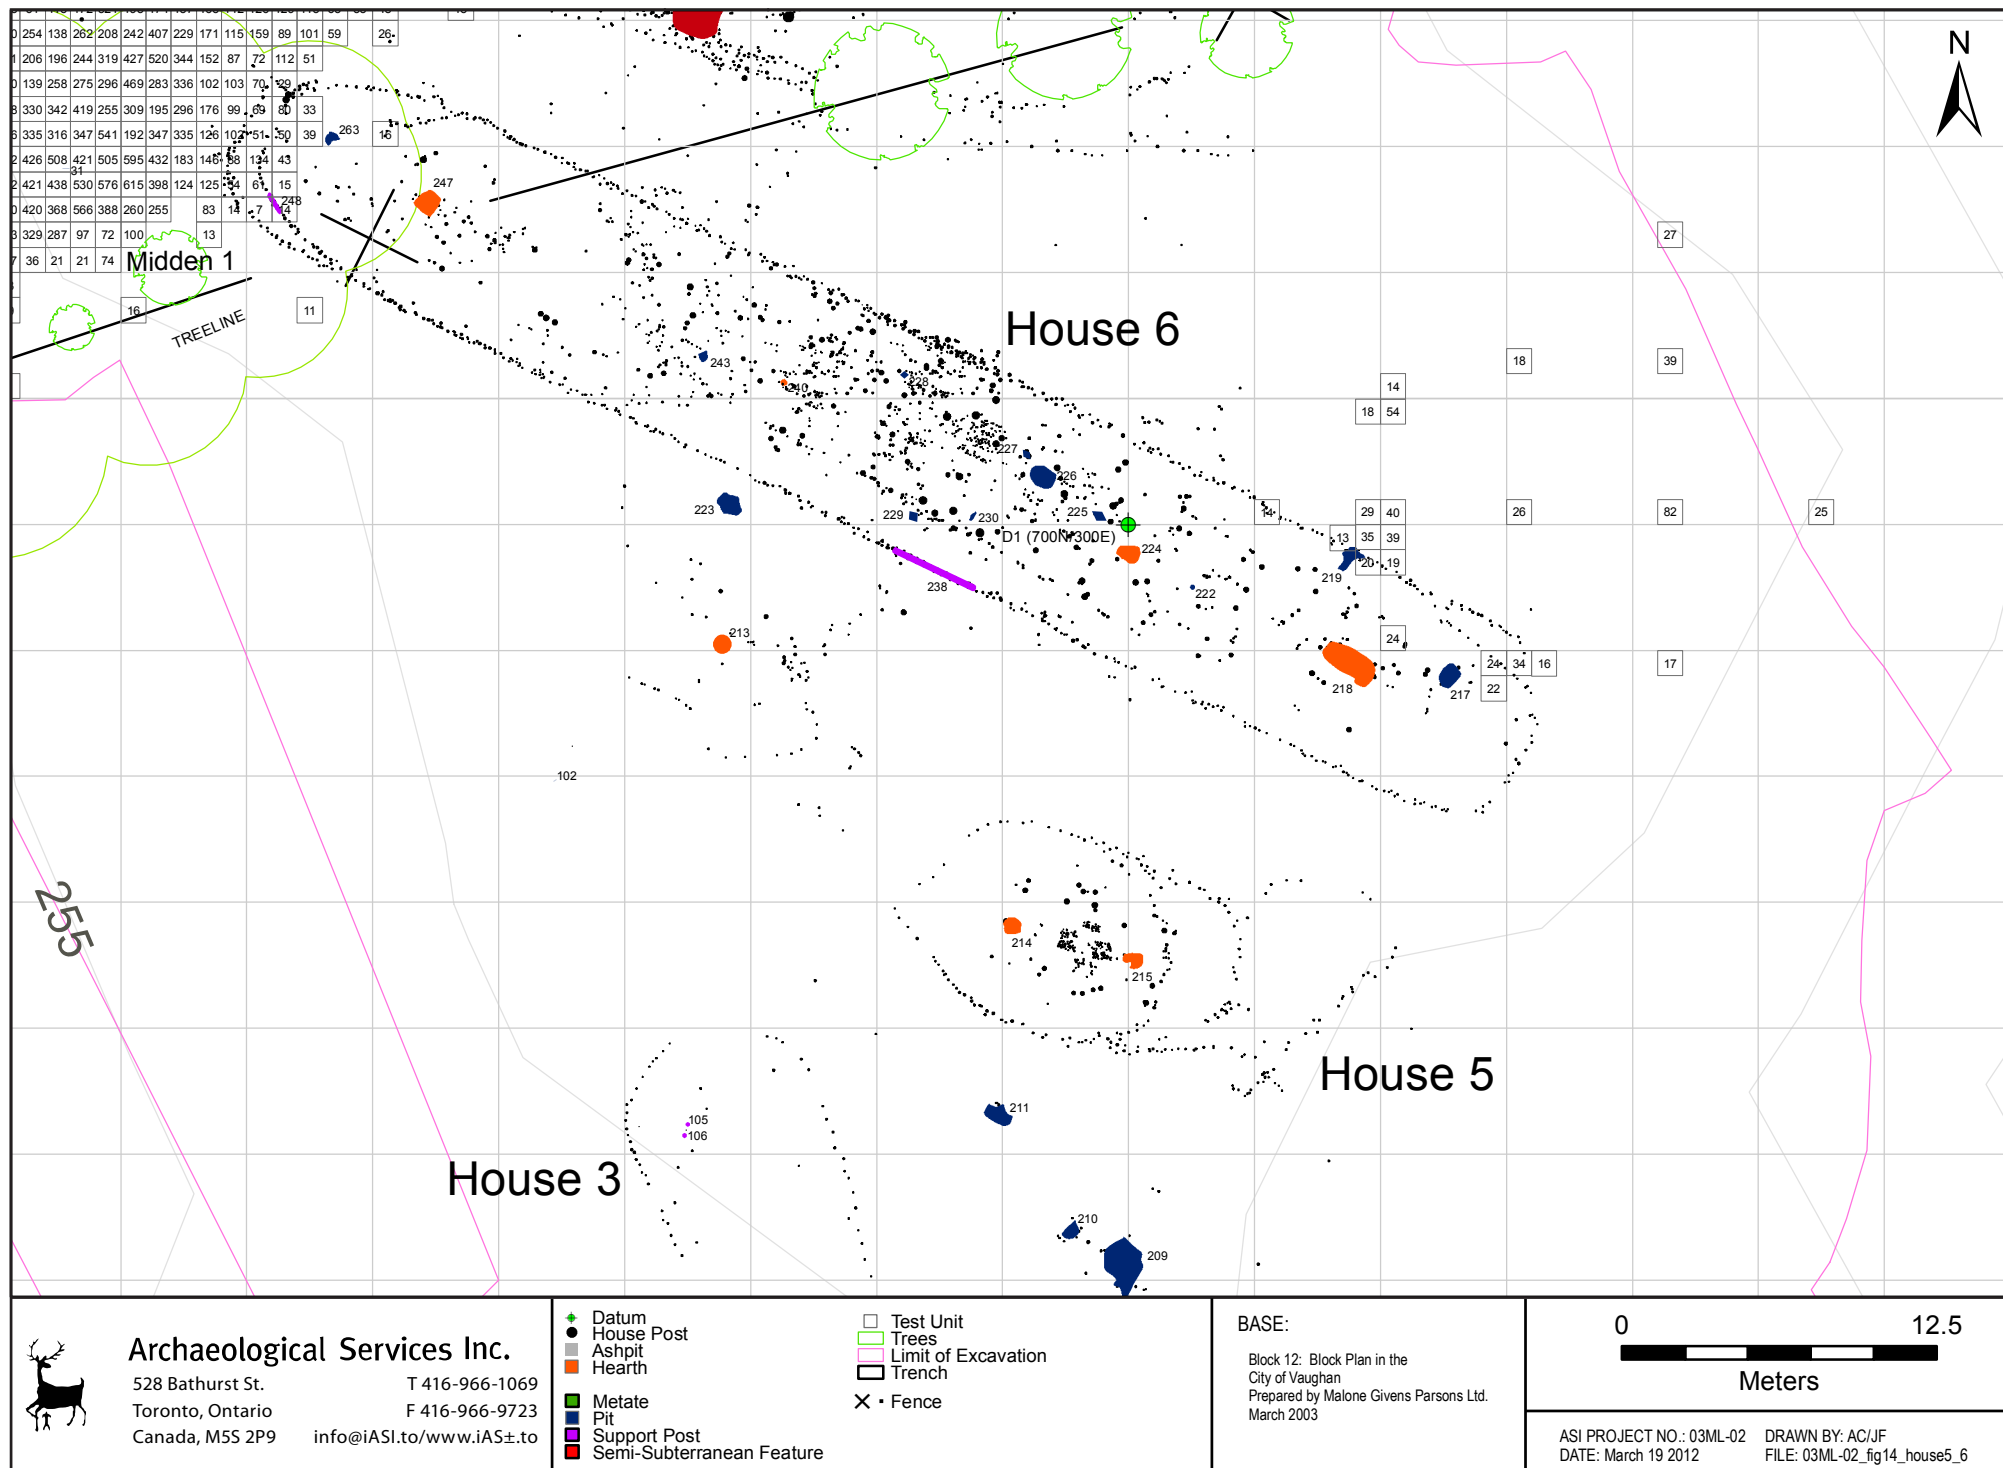

Figure 14: Plan View of House 5 & House 6

2.2.6 House 6

Oriented 295° east of north (Figure 14 and Table 6), House 6 had a bearing similar to that of House 5, located roughly seven metres to the southwest. House 6 was much longer than House 5, however, extending past the tree line separating Lots 24 and 25 and into the southeast corner of Midden 1. Given its proximal location, the inhabitants of House 6 likely contributed to the creation of this feature.

House 6 had two extensions or episodes of rebuilding at its west end. With an original length of approximately 52 metres, these minor additions would have resulted in overall lengths of 55 metres and 56 metres, respectively. At a width of 8.1 metres, this provided enclosed areas of 421.2, 445.5 and 453.6 square metres for each of the respective configurations (Table 2). These additions, however, may have been more apparent than real. Closer examination reveals that the original west end wall was not complete, extending less than three metres from the north wall, and may simply represent a screen or separation on the north half of the west end of the house. The second west end wall was complete and contains a distinct doorway, and had every appearance of being an actual end wall. The apparent third wall, like the first, was also not complete. Although it clearly extended from the south wall, this third wall ended abruptly just beyond the doorway of the second end wall and appeared to turn into it. Given the manner in which this supposed third end wall terminated, along with its location only one metre beyond the doorway and second end wall, it was more likely a screen, fence or partial end meant to protect and/or conceal the doorway. Therefore, it seems likely that House 6 had only one west end wall with a length of 55 metres.

The west end of House 6 was gently rounded and level at its centre, near the location of the doorway, while the east end turned more abruptly into a flattened segment (Figure 14). Three possible openings were visible here, two by the southeast corner and one at the northeast corner. Since soil conditions were good and post moulds quite distinct at this end of the house: any or all of these areas may have been used as doorways. Another possible opening existed at the northeast end of the north wall where a short fence protrudes from the house (Figure 14). Other, apparent gaps in the south and north walls were more likely the result of disturbance rather than actual doorways. No partition walls appeared at the east end of this structure. The walls of the house were formed primarily by paired and occasionally single row posts, although a six metres long concentration of posts was found at the midway point of the north wall, perhaps indicating some repair activity.

The distribution of interior and support posts in House 6 indicates the presence of a south bunk line along with a probable north bunk line. The north bunk line was obscured by numerous support and smaller posts near the centre of the structure (Figure 14). The north and south bunk lines were approximately 1.9 metres wide providing a central corridor width of 4.3 metres.

Seventeen features were encountered in House 6 (Figure 14 and Table 6). Two of these features, Features 238 and 248, were the remains of wall trenches documented in the south wall and west end wall, respectively. Feature 238 contained as many as 30 posts while Feature 248 contained ten posts. Only one feature, Feature 229, was located within the south bunk line. It was situated near the centre of the house and contained pottery and FCR. Two features, Features 219 and 228, were situated in the north bunk line. Feature 219 was a pit that impacted the north wall of the house, while Feature 228, also a pit, contained pottery. Feature 228 was found near the busy centre section of House 6. The presence here of numerous posts somewhat obscured the precise position of this feature, but it can probably be placed within the north bunk line. Feature 263, a refuse pit containing pottery, chert and FCR, was situated in the probable cubicle discussed above at the west end of the house, while another refuse pit (Feature 217) was located in a possible storage cubicle at the east end of the house.

Table 6: House 6 Summary Description of Features

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Location	Contents. Fill Composition
248	Wall Trench	97	20	10	Rectangular/No Profile	H6 West Wall	Fill: dark soil mottled with subsoil and charcoal (10Yr3/3 - dark brown). 10 posts in wall trench
263	Pit	62	40	26	Irregular/Irregular	H6 West End	Pottery, chert, FCR. Fill: dark soil mottled with charcoal and subsoil (10Yr3/1 - very dark grey)

The remaining ten features were situated within the central corridor and consisted of four hearths, (Features 218, 224, 240 and 247), and six refuse pits, (Features 225, 226, 227, 228, 230 and 243) (Figure 14 and Table 6). The six pits and two of the hearths, Features 224 and 240, were concentrated near the centre of the house. It is within this section that an exceptionally large number of posts were concentrated (Figure 14). The density of posts combined with the presence of most features identified within the central corridor indicates that considerable activities occurred in this location. The other two hearths, Features 218 and 247, situated toward the east and west ends of the house, respectively, were also surrounded by a high number of posts, but limited in comparison to the post density in the centre of the house (Figure 14).

House 6 appears to have been similar to House 2 with respect to the concentration of features and density of posts in the central section of the house, thus revealing that most house activity occurred in this area. Unlike House 2, however, considerable activity also seems to have occurred around the hearths situated towards the east and west ends of House 6, Features 218 and 247, respectively.

2.2.7 House 7/8

The remains of two longhouses, referred to jointly as House 7/8 due to their overlapping nature, were encountered approximately five metres north of, and nearly parallel to, House 6 (Figure 8). For the purposes of this report, House 7 refers to the longhouse with two apparent ends while the incomplete and poorly defined structure is House 8. Most of the eastern extent of these structures was found to lie within the tree line separating Lots 24 and 25. The western end of these houses extended just to the north of Midden 1. Given this location, it would appear that the inhabitants of House 7/8, like the occupants of House 6, also contributed to the creation of this midden.

House 7/8 is somewhat challenging to describe, in part because the features associated with the eastern portion of these houses, as noted above, were located beneath rather substantial trees and tree roots. Consequently, the east end walls were poorly defined. Moreover, the west end of House 8 was not defined at all; much of its south wall and some of its north wall were missing. Even the better defined House 7 appeared to be lacking much of its east end wall. Although the remains of such a wall were present, it was not precisely clear to which house this end belongs, or if it may actually be a partition rather than an end segment. Assuming it was an end wall, House 7 was orientated 295° east of north (Figure 15 and Table 7) with a width of 7.7 metres and length of 45 metres, comprising an overall area of 346.5 square metres. Accurate assessments of the length, width and area of the House 8 cannot be determined.

The west end of House 7 was gently rounded and flattened at its centre (Figure 15). A doorway may have been present at the centre of the end wall and/or possibly at the northeast edge. The incompletely defined east end wall or partition, as the case may be, appeared more rounded. Since sections of the north and south walls of this dwelling were also ill defined in places, it is not possible to conclusively identify any doorways. Where walls were identified, it appears that the houses were formed primarily by paired and single row posts.

The distribution of interior and support posts in one of the houses was fairly well-defined and indicates the presence of a north and south bunk line. Another north bunk line, presumably associated with the second house, was occasionally detected, while a second corresponding south bunk line was all but invisible (Figure 15). The north and south bunk lines were approximately 1.9 metre in width giving rise to a 3.9 metre wide central corridor. Although the lack of clarity in defining the overlapping houses can partly be attributed to interference within the tree line, this cannot be applied to the lack of posts within the west end of House 8. It is possible construction of this house was never completed.

Table 7: House 7/8 Summary Description of Features

Feat. No.	Feat. Type	Dimensions (l, w, d; in cm)			Plan/Profile Shape	Location	Contents. Fill Composition
245	Sweat lodge	286	230	42	Keyhole/Flat Bottom	H7 South Bunk/East End	Pottery: including complete miniature pot, chert, bone, ground stone, FCR. 258	Wall Trench	252	62	11	Irregular/Irregular	H7 North Wall	Pottery, chert. 19 posts in wall trench. Fill: dark soil mottled with charcoal and pale soil (10yr3/3 - dark brown)
260	Pit	72	58	08	Ovate/Shallow Basin	H7 Centre	Fill: dark soil mottled with subsoil and charcoal (10yr4/4 - dark yellowish brown)

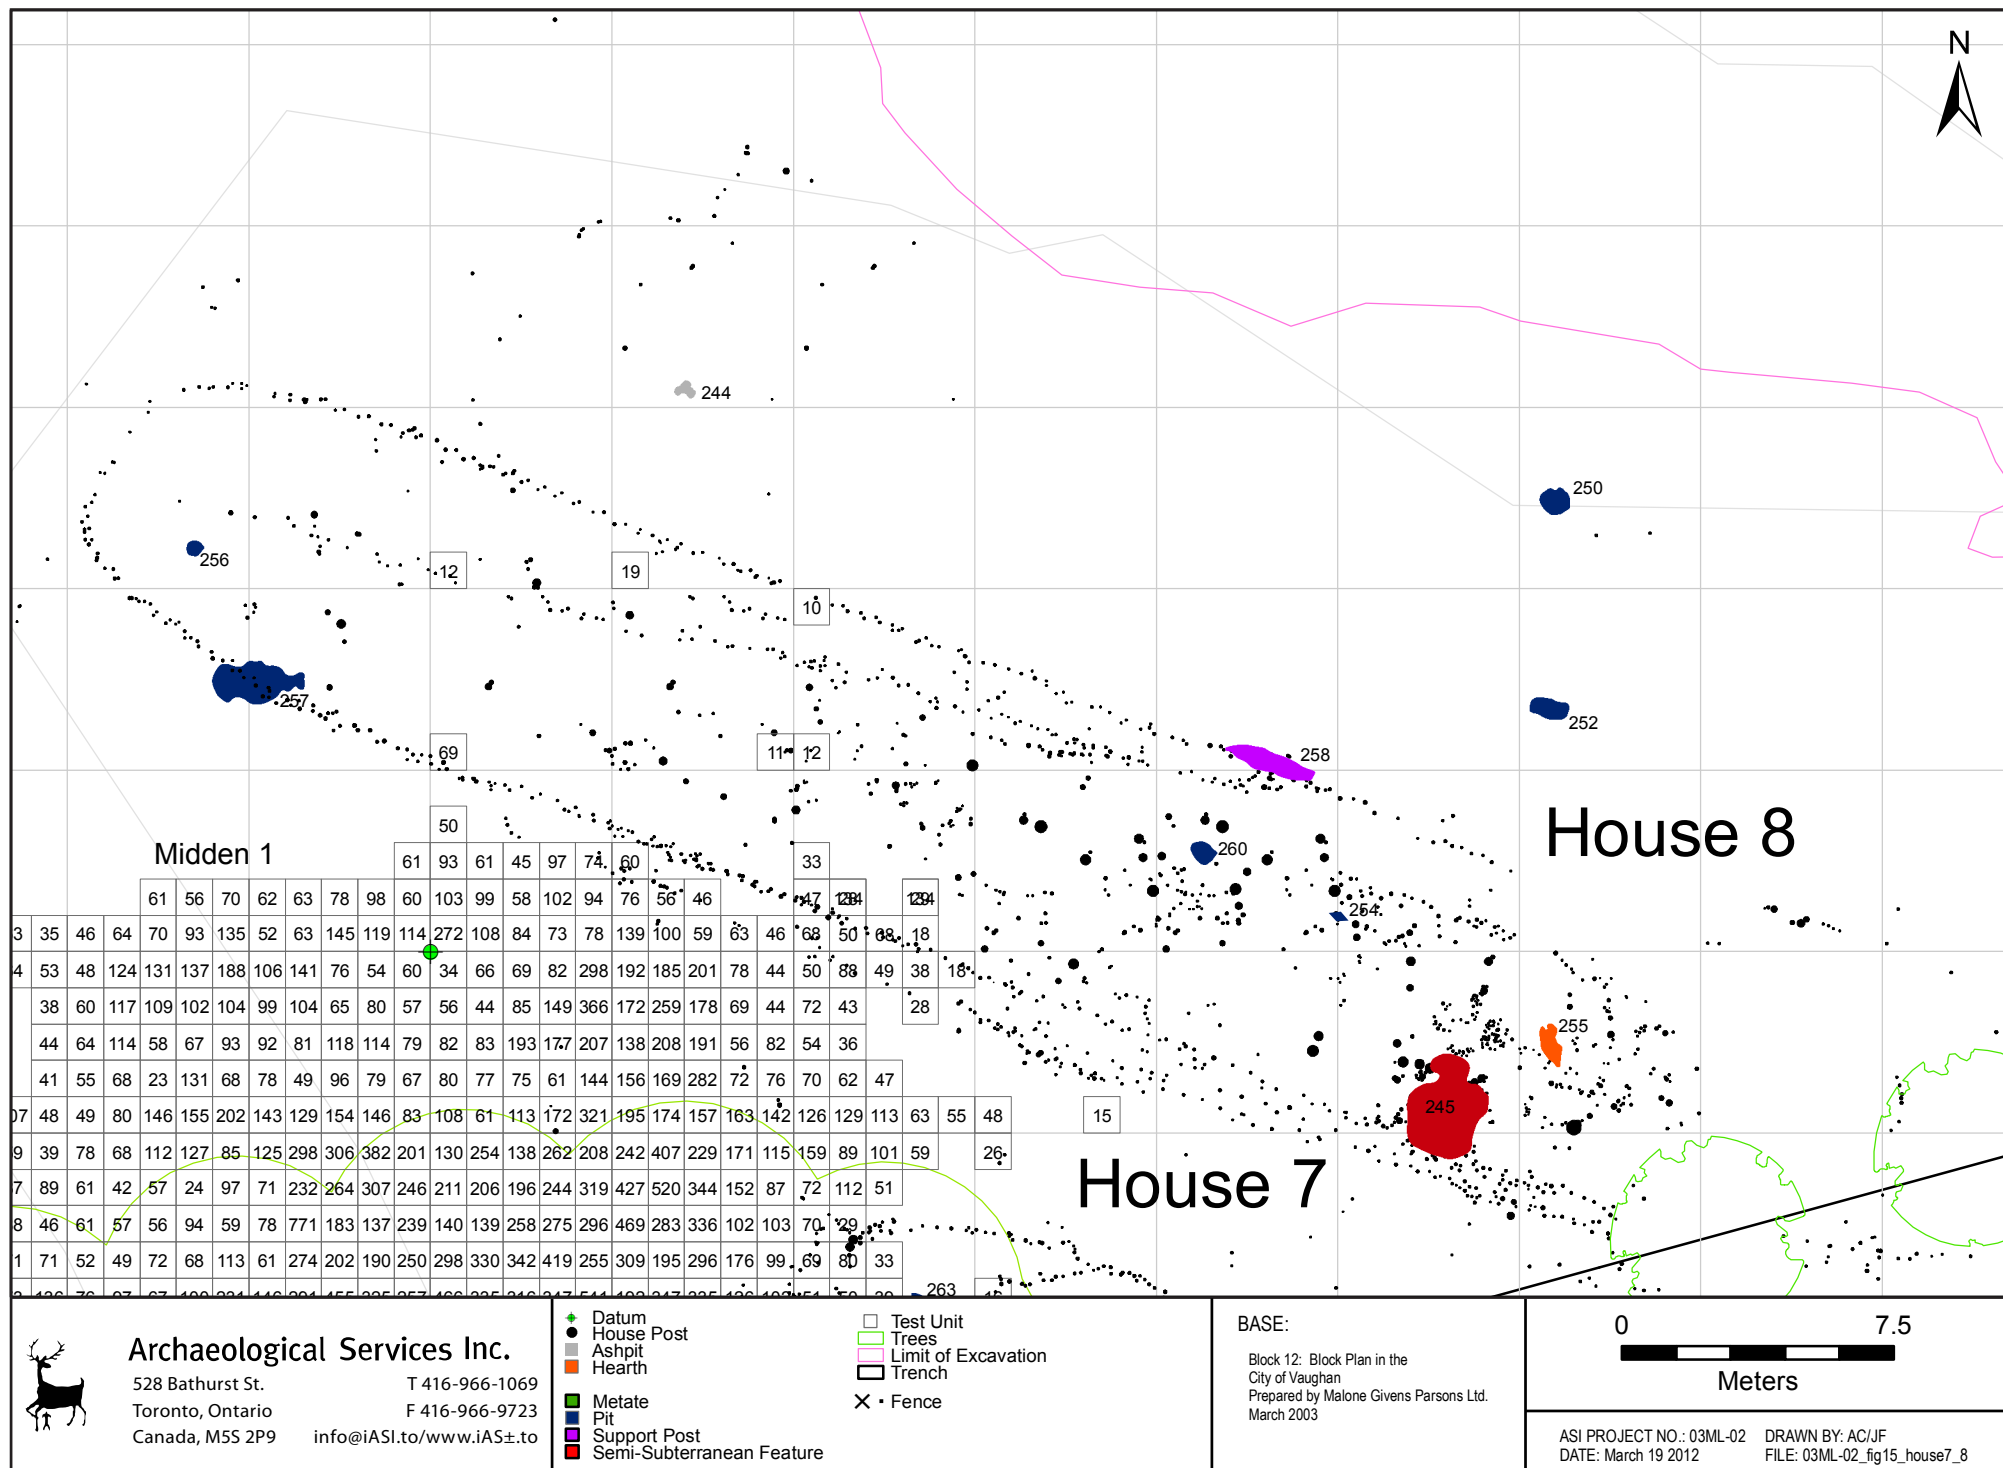

Figure 15: Plan View of House 7 & House 8

As noted in Table 7, seven features were found in House 7/8. One of these, Feature 257, appears not to be associated with House 7 as it was superimposed upon and therefore postdated the south wall posts of this structure. Therefore, this feature either relates to the incomplete House 8 or was exterior to House 7.

Three of the features, Features 254, 256 and 260 were pits. Feature 254 comprised a pit that contained a large support post. Although it appears to have been situated within the corridor of House 7, and may thus have served as a central post, it may also have been attributed to the bunk line of House 7 or the bunk line of an incomplete House 8. That it was surrounded by a cluster of posts, however, suggests it was more likely associated with activity areas within the central corridor of House 7. Feature 256 was situated at what appears to be the west end of House 7, probably within the centre line, as is suggested was the case with Feature 260. While Feature 256 seems to be somewhat isolated with few associated posts, both Features 254 and 260 point to active areas within the central corridor. Feature 258 is a wall trench encountered in the north wall of House 7 (Figure 15). It was unusually deep and contained at least 19 wall posts.

The remaining two features, Features 245 and 255, appeared to be situated within the east end of House 7. Feature 255 was a hearth and, while unusually situated so near a house end, was associated with a cluster of posts, a common occurrence for these features.

Feature 245, a semi-subterranean sweat lodge, was oriented perpendicular to the long axis of House 7. Although within the supposed boundaries of the east end of the dwelling, it may be more appropriately placed within the House 7 south bunk line. The ramp end and entrance were situated at its north edge, facing north and extending into the central corridor of the house (Figure 15) adjacent to a concentration of posts. The south edge of the main body of the sweat lodge appeared to impact the south wall of the house and was most likely incorporated into the construction of House 7 to maintain its structural integrity (Figure 15). Feature 245 had an asymmetrical keyhole plan and a regular flat bottom profile. It measured 2.86 metres in length, 2.30 metres in width and 42 centimetres in depth. Pottery, chert, ground stone, bone and FCR were recovered from this feature. Included in the pottery sample was a nearly complete miniature pot (see Section 3.13.1, Plate 32 Cat.#4489 classified as a juvenile vessel) recovered from the top of the living floor (Plates 6 and 7). It should also be noted that two exceptionally large boulders were encountered at the northwest edge of the feature, which may or may not be associated with the sweat lodge.

Plate 6: Ceramic vessel (Cat.#4489) recovered from Feature 245 in House 7.

Plate 7: Close up of ceramic vessel (Cat.#4489) recovered from Feature 245 in House 7

2.3 Exterior Fences

Four apparent series of fence rows were encountered at the McNair site. The first comprised a rather haphazard line of posts, which diverged into two lines forming a vague circle in its centre, situated between the east side of House 2 and the southwest corner of House 4. Taken together, these rows of posts were approximately 20 metres in length. Numerous pit features were found around and north of these fence rows and were likely related to the exterior activities conducted at this location, designated as House 2/4 Exterior Activity Area and discussed below.

A second series, approximately 15 metres long and connected to the east end wall of House 5, served to define and possibly enclose a space adjacent to this structure. Although this space may be considered an exterior activity area, it is not treated as such in the discussion below due to its close association with House 5 and the dearth of associated features.

A third series, situated to the northwest of House 5 and immediately south of House 6, appeared to form several semi-circles with an additional fence row connecting this area with the south wall of House 6. Four sets of paired posts were visible in this row to the southwest of Feature 213. These fences appear to be associated with external activities as indicated by the presence of features.

The fourth series, some seven metres long and obscured at its north end by the tree line, may have connected House 6 with House 7/8. Since no exterior features seem to be associated with this fence, it may simply have functioned as a windbreak. Other possible fence rows are considered post clusters associated with exterior activity areas and are discussed below.

2.4 Exterior Activity Areas

Excluding Midden 1, 28 features (15 percent of all features) were recorded in open-air contexts which may be grouped into at least ten discrete exterior activity areas.

2.4.1 Exterior Activity Area 1

Exterior Activity Area 1 is situated at the south end of the site between the ends of House 1 and House 2 (Figures 8 and Table 8). Six features were distributed across this 30 metre square area and include three hearths (Features 11, 12 and 96), and three pits (Features 13, 27 and 97). Although Features 12, 13 and 96 contained artifacts, no posts were found near or seemed to be associated with these features. Given the distance between each of these features and absence of any other exterior fence row or post cluster, it is impossible to ascertain how these features related to one another, if at all, or what specific activity or activities may have occurred at this location.

Table 8: Summary of Features Associated with Exterior Activity Area 1

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Location	Contents. Fill Composition
11	Hearth	55	50	15	Irregular/Deep Basin	West of House 1	Fill: dark soil mottled with charcoal and fired soil (10yr3/2 -very dark greyish brown)
12	Hearth	112	38	07	Irregular/Shallow Basin	West of House 1	Pottery. Fill: dark soil mottled with charcoal and fired soil (10yr3/2 - very dark greyish brown)

Table 8: Summary of Features Associated with Exterior Activity Area 1

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Location	Contents. Fill Composition
13	Pit	102	56	23	Irregular/Irregular	South of House 2	Pottery, bone, carbonized corn. Fill: dark soil mottled with charcoal 10yr2/1 - black)
27	Pit	33	29	18	Ovate/Irregular	South of House 1	Lenses: L1 (main): dark soil mottled with charcoal and subsoil (10yr4/1 - dark grey); L2 (lens): charcoal mottled with dark soil (10yr2/1 - black)
96	Hearth	171	89	14	Irregular/Irregular	South of House 1	Pottery, chert. Lenses: L1 (top): subsoil mottled with fired soil (10yr8/4 - very pale brown); L2 (main): fired soil mottled with subsoil and dark soil (10yr5/6 - yellowish brown)
97	Pit	59	48	40	Ovate/Shallow Basin	South of House 1	Fill: subsoil mottled with dark soil and charcoal (10yr4/4 - dark yellowish brown)

2.4.2 House 2/4 Exterior Activity Area

The House 2/4 Exterior Activity Area was situated between Houses 2 and 4, around and north of a series of fence rows as described above (Figure 8). A total of eight features, Features 113, 115, 116, 117, 118, 202, 203 and 205, were located within this area (Table 9). Feature 205 comprised a sterile pit situated two metres west of House 4 and some 12 metres north of Features 202 and 203. Given its lack of artifacts and its distance from the other features, it is uncertain whether this feature was related to the others in this activity area. Features 202 and 203, situated approximately seven metres southwest of House 4 and 20 metres north of the fence rows, consisted of a hearth and sterile pit, respectively. Their close proximity suggests they may be related to one other but an absence of artifacts obscures their purpose and relationship with the other features in this activity area. Like Feature 205, Feature 113 is also an isolated pit devoid of contents. It was situated approximately four metres east of House 2 and 12 metres north of the fence row. Its relationship to the other features in this activity area is not clear. The remaining four features, Features 115, 116, 117 and 118, comprised the main loci of this area; they were in close proximity to each other and to the fence rows between the houses. These four features consisted of pits, two of which (Features 116 and 117) contained pottery, while the other two were sterile. The existence of the fence rows and the proximity of the features to them suggests they were inter-related. The four features likely acted as refuse pits for whatever activity occurred here.

Table 9: Summary of Features Associated with House 2/4 Exterior Activity Area

Feat. No.	Feat. Type	Dimensions (l, w, d; in cm)			Plan/Profile Shape	Contents. Fill Composition
113	Pit	24	19	14	Ovate/Conical	Lenses: L1 (main): dark soil mottled with charcoal and subsoil (10yr4/2 - dark greyish brown); L2 (lens): subsoil mottled with dark soil (10yr 6/6 - brownish yellow)
115	Pit	96	50	11	Ovate/Shallow Basin	Fill: dark soil mottled with subsoil, charcoal and ash (10yr4/2 - dark greyish brown)
116	Pit	61	45	16	Irregular/Shallow Basin	Pottery. Lenses: L1 (top): dark soil mottled with subsoil and charcoal (10yr4/1 - dark grey)
117	Pit	46	46	22	Ovate/Deep Basin	Pottery. Fill: dark soil mottled with charcoal, subsoil and ash (10yr3/1 - very dark grey)

Table 9: Summary of Features Associated with House 2/4 Exterior Activity Area

Feat. No.	Feat. Type	Dimensions (l, w, d; in cm)			Plan/Profile Shape	Contents. Fill Composition
118	Pit	77	25	05	Irregular/Shallow Basin	Fill: dark soil mottled with subsoil and charcoal (10yr5/1 - grey)
202	Hearth	90	12	05	Irregular/Irregular	Lenses: L1: (top): dark soil mottled with subsoil and charcoal (10yr3/2 - very dark greyish brown); L2 (main): fired soil mottled with dark soil and subsoil (7.5yr6/6 - reddish yellow); L3 (bottom): dark soil mottled with subsoil (7.5yr4/6 - strong brown)
203	Pit	59	22	08	Irregular/Shallow Basin	Fill: dark soil mottled with subsoil (no Munsell)
205	Pit	88	25	19	Irregular/Irregular	Fill: dark soil mottled with charcoal and subsoil (10yr3/2 - very dark greyish brown)

2.4.3 House 1 North Exterior Activity Area

This area comprises one feature, Feature 58, and possibly two posts situated immediately north of House 1 (Figure 8). Feature 58 was an irregularly shaped ash pit measuring 144 centimetres in length, 90 centimetres in width and 20 centimetres deep. It produced pottery, chert and bone and consisted of four layers: L1 was a dark soil mottled with ash and charcoal (10yr4/1 - dark grey); L2 was a dark soil mottled with subsoil (10yr4/3 - brown); L3 was a subsoil mottled with ash and charcoal (10yr6/1 - grey); and L4 was dark soil mottled with charcoal and ash (10yr3/1 - very dark grey). Given its feature fills and proximity to House 1, Feature 58 was presumably used as a refuse pit for at least one of the House 1 hearths.

2.4.4 House 4 East Exterior Activity Area

This area contained a small, sterile pit (Feature 182) situated some 10 metres to the east of House 4 (Figure 8). Feature 182 measured 16 centimetres in length, 16 centimetres in width and 15 centimetres in depth. Fills consisted of a dark soil mottled with charcoal (10yr3/2 - very dark greyish brown). Despite its proximity to House 4, Feature 182 may not have been related to this structure

2.4.5 House 2/4 North Exterior Activity Area

This activity area consisted of two isolated features: Features 99 and 109, located some 20 metres apart and roughly 20 metres and 15 metres from the north ends of House 2 and House 4, respectively (Figure 8). Feature 99 comprised a sterile, shallow pit and measured 61 centimetres in length, 30 centimetres in width and 10 centimetres deep. The pit was ovate in plan and basin shaped in profile. Two soil fills were documented: L1 (main) consisted of a dark soil mottled with subsoil and charcoal (10yr3/1 - very dark grey) while L2 (lens) was a subsoil mottled with dark soil (10yr7/4 - very pale brown). Feature 109 comprised an irregularly shaped hearth measuring 77 centimetres in length, 65 centimetres in width and six centimetres in depth. Soil fill consisted of subsoil mottled with fired and dark soils (5yr4/6 - yellowish red). It is unclear as to the nature of the activities that produced these features.

2.4.6 House 3/5 Exterior Activity Area

This activity area refers to the locale between Houses 3 and 5, containing Features 208, 209, 210 and 211 (Figure 8). All four features were pits, two of which, Features 208 and 210, were sterile (Table 10). With the exception of Feature 208, several posts were situated within or immediately around each feature, suggesting the activities that took place here were recurrent. The nature of these activities, however, remains unclear but may relate to the use of House 5, situated to the north.

Table 10: Summary of Features Associated with House 3/5 Exterior Activity Area

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Contents. Fill Composition
208	Pit	49	34	13	Irregular/Irregular	Fill: dark soil mottled with charcoal and subsoil (10yr3/2 - very dark greyish brown)
209	Pit	241	157	21	Irregular/Irregular	Pottery, chert, bone, FCR. Contemporary with 12 posts. Lenses: L1(main): dark soil mottled with charcoal (10yr2/1 - black); L2 (lens): dark soil mottled with charcoal, ash and subsoil (10yr3/2 - very dark greyish brown); L3 (lens): subsoil mottled with charcoal, dark soil and ash (10yr4/3 - brown)
210	Pit	80	70	18	Irregular/Skewed	Ringed by semi-circle of 6 posts at one end and 1 large post at other end; Lenses: L1 (top): dark soil mottled with charcoal (10yr2/2 - very dark brown); L2 (bottom): dark soil mottled with charcoal and subsoil (10yr3/3 - dark brown)
211	Pit	114	74	12	Irregular/Shallow basin	Pottery, chert, FCR. Fill: dark soil mottled with subsoil and charcoal (10yr2/2 - very dark brown)

2.4.7 House 5/6 Exterior Activity Area

Situated roughly 10 metres northwest of House 5 and adjacent to House 6 (Figure 8 and Table 11), the House 5/6 exterior activity area consists of three features as well as several rows and cluster of posts. Feature 213, a hearth, was proximal to one row and one cluster of posts and may have been the centre of activity in this location. Two pits, Features 102 and 223, were also documented. Feature 102, a small and shallow pit devoid of contents, was encountered approximately 14 metres southwest on House 6. Its function, as well as its association with adjacent features, is not clear. The presence of FCR in Feature 223, a larger and deeper pit found immediately south of House 6, suggests it may have served as a refuse pit for activities carried out around Feature 213. Like the House 3/5 Exterior Activity Area, use of this locale may relate to the enigmatic function(s) of House 5.

Table 11: Summary of Features Associated with House 5/6 Activity Area

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Contents. Fill Composition
102	Pit	13	11	50	Ovate/Shallow Basin	Fill: dark soil mottled with charcoal and subsoil (10yr3/1 - very dark grey)
213	Hearth	75	75	80	Circular/Irregular	Fill: subsoil mottled with fired soil (5yr5/6 - yellowish-red)
223	Pit	110	73	58	Irregular/Deep Basin	Pottery, FCR. Fill: dark soil mottled with subsoil (10yr4/2 - dark greyish brown)

2.4.8 Houses 6 and 7/8 Exterior Activity Area

A considerable number of posts were encountered between Houses 6 and 7/8. A fence row appears to have connected the House 6 north wall with the east end of House 7 (Figure 8). As the tree line at this location obscured the east end of House 7, however, along with the precise association of a number of rows of posts adjacent to the east end of House 7, it is unclear to what exactly this fence connected. It may simply have acted as a windbreak, but some limited, ephemeral activities may have taken place here.

2.4.9 House 7/8 Exterior Activity Area A

This activity area was situated at the northwest corner of the site, west of the end of House 7/8 and north of Midden 1 (Figure 8). Although no features were identified in this location, several small post clusters were encountered, indicating that some form of activity occurred here.

2.4.10 House 7/8 Exterior Activity Area B

This activity area was situated to the north of House 7/8 at the north edge of the site (Figure 8 and Table 12). One feature, Feature 244, was found among a constellation of posts, while two others, Features 250 and 252, were situated about 25 metres to the east (Figure 8). Feature 244, as an ash pit containing charcoal, may have served as a disposal area for hearth contents although no hearths were documented in the immediate area. Features 250 and 252 could have served as refuse pits for the occupants of House 7/8. Given the distance separating Features 250 and 252 from Feature 244 and the cluster of posts, their purpose and use may not have been related.

Table 12: Summary of Features Associated with House 7/8 Exterior Activity Area B

Feat. No.	Feat. Type	Dimensions L, w, D in cm			Plan/Profile Shape	Contents. Fill Composition
244	Ash Pit	70	40	12	Irregular/Irregular	Lenses: L1 (main): dark soil mottled with charcoal and subsoil (10yr3/1 - very dark grey); L2 (lens): ash mottled with charcoal (10yr6/1 - grey)
250	Pit	50	45	19	Ovate/Irregular	Pottery. Lenses: L1 (main): dark soil mottled with subsoil and charcoal (10yr3/1 - very dark grey); L2 (lens): subsoil mottled with dark soil (10yr4/4 - dark yellowish brown)
252	Pit	110	57	90	Ovate/Shallow Basin	Fill: subsoil mottled with dark soil (10yr3/4 - dark yellowish brown)

2.4.11 Midden 1

Midden 1 was encountered at the west end of House 6 and approximately 10 metres south of the west end of House 7/8 (Figures 8 and 16). Four hundred and seventy-six one metre square excavation units, hand excavated to subsoil and screened through six millimetre wire mesh, were block excavated within this area (Figures 8 and 16). As well, the floors of each square were carefully examined for evidence of features or post moulds, and stratigraphic profiles were documented. This work established that Midden 1 covered an area of nearly 600 square metres and contained rich artifact deposits with depths up to 50

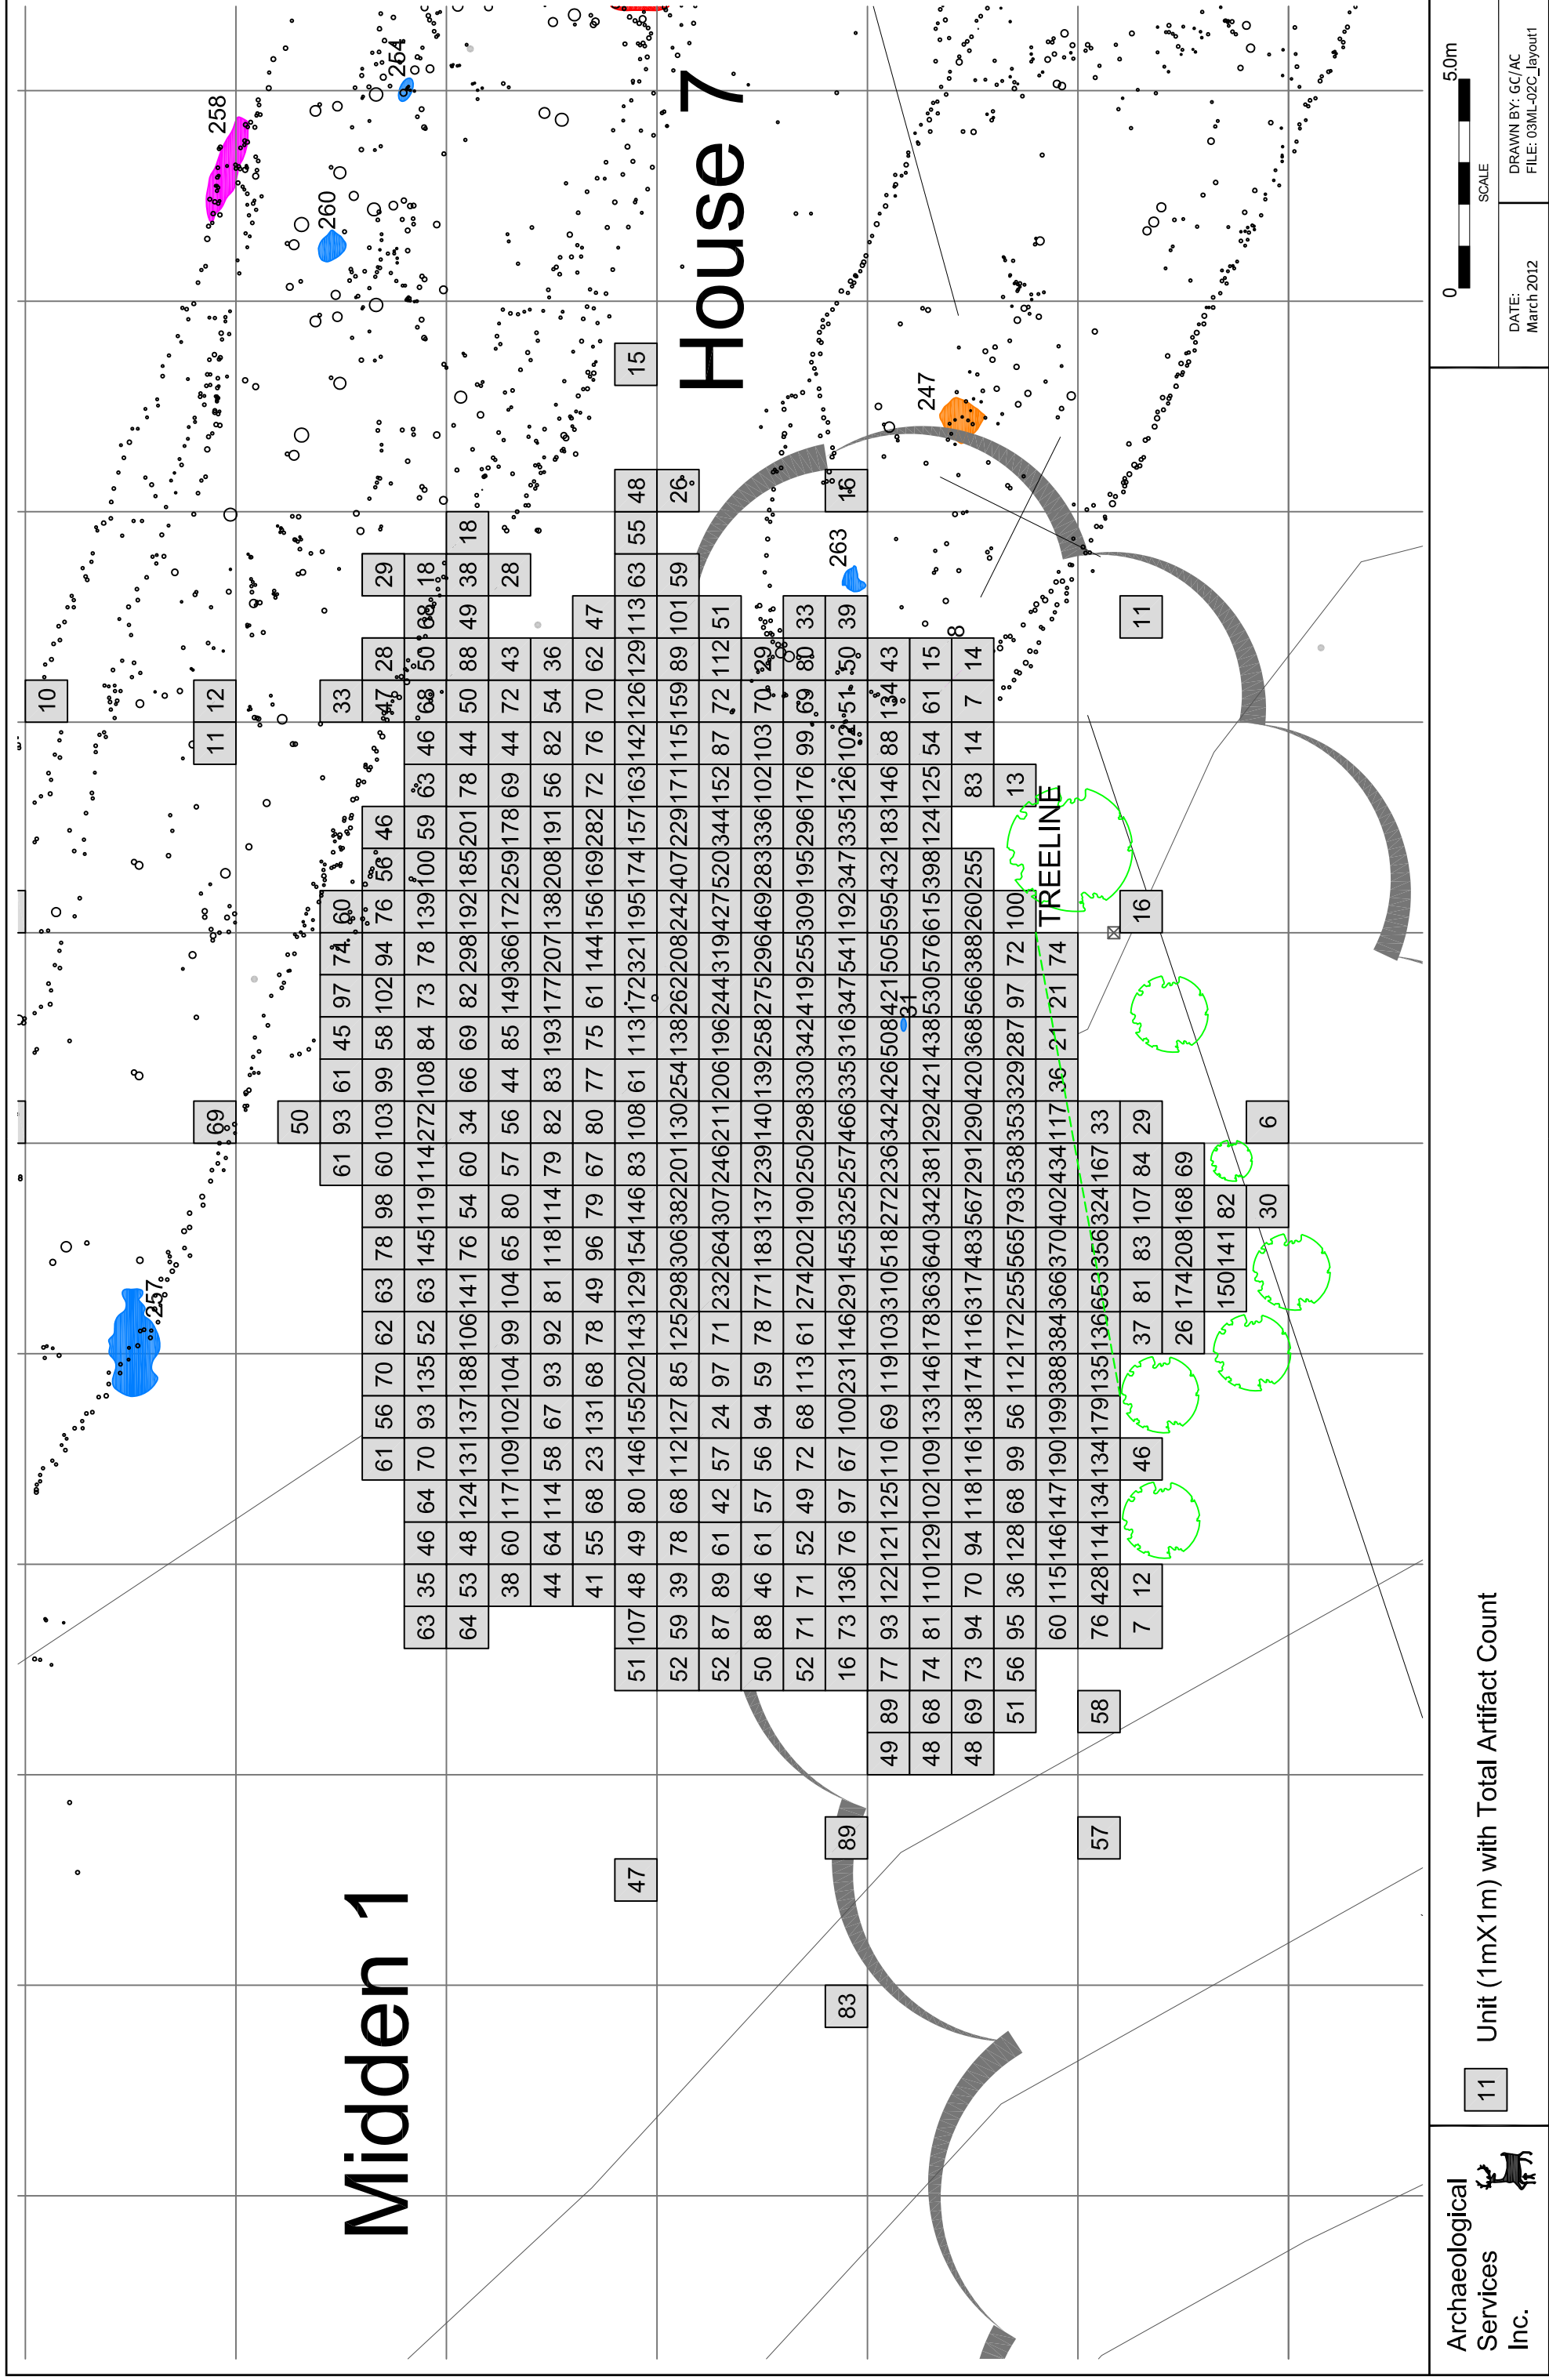

centimetres. The proximity of Midden 1 to Houses 1 and 6 suggests their occupants were the primary contributors to the midden.

2.4.12 Midden 2

Midden 2 was encountered at the east end of House 6 (Figures 8 and 17). Twenty-three one metre square excavation units, hand excavated to subsoil and screened through six millimetres wire mesh, were strategically placed within and around this area. As well, the floors of each square were carefully examined for evidence of features or post moulds, and stratigraphic profiles were documented. Further hand-excavations in Midden 2 were far more limited, in light of the general predominance of highly comminuted and exfoliated ceramics that are of limited or no analytical value. Twenty three units were excavated within this portion of the site. The artifacts in this area represent the vestiges of low-level refuse accumulation at the end of House 6 rather than a rich long-term midden, such as Midden 1 which likely served both Houses 6 and 7.

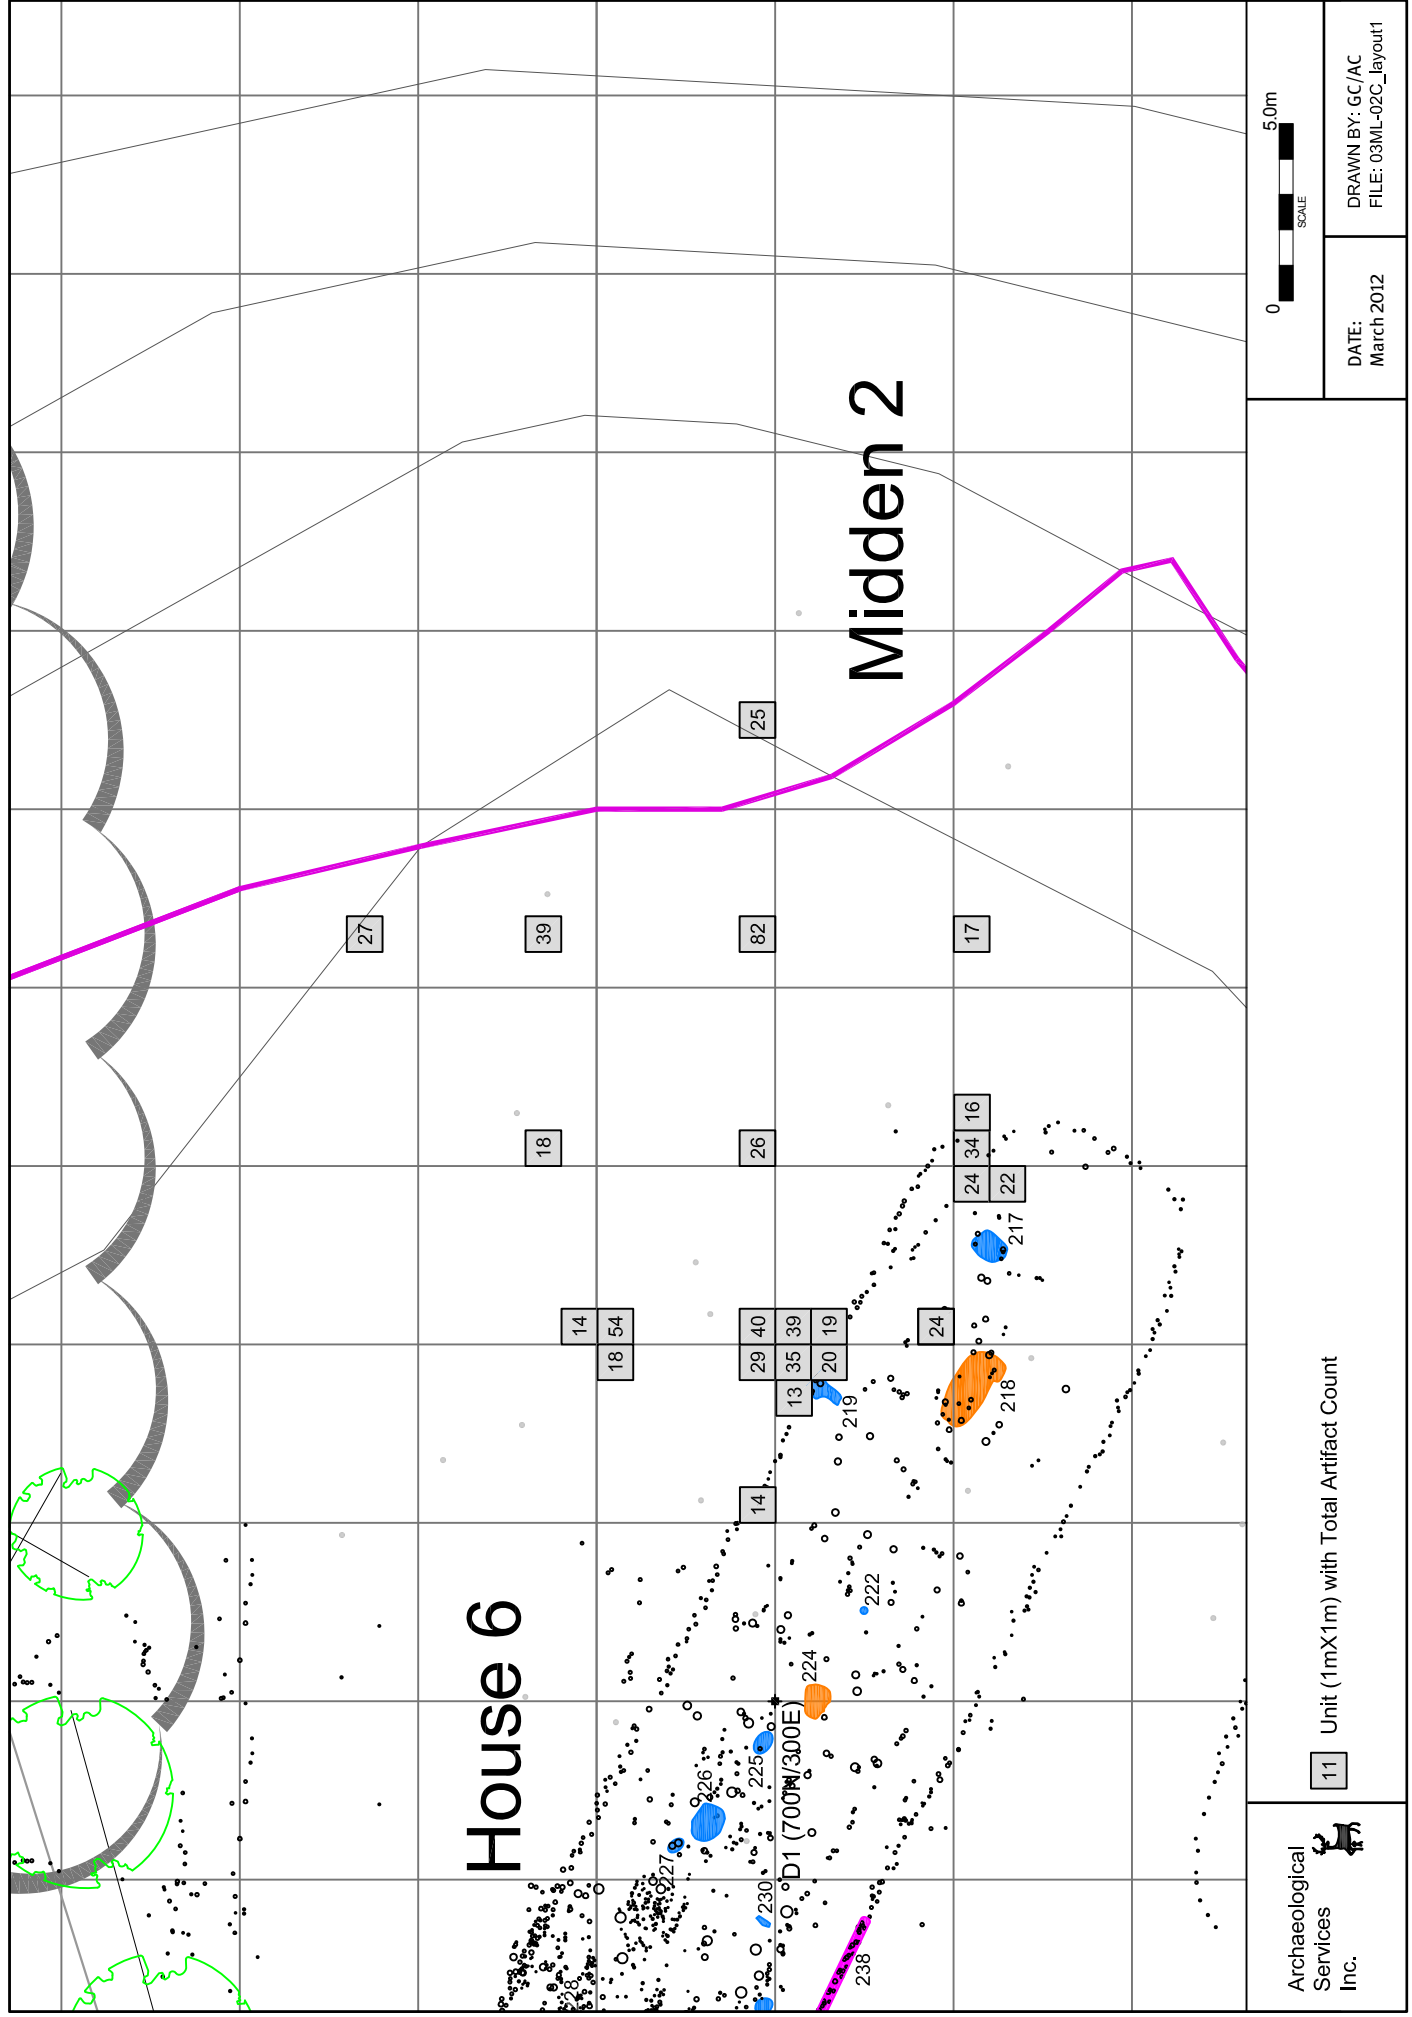

Figure 17: Results of Stage 3-4 Excavation of Midden 2 at the McNair site (ALGu-8)

3.0 CERAMIC ARTIFACT ANALYSIS

Aleksandra Pradzynski

3.1 Introduction

In total, 1,988 ceramic artifacts were recovered during the 2003 Stage 3 investigation at the McNair site (Table 13). Whenever possible, all ceramic artifacts were mended prior to analysis to the minimum number by provenience

Of these ceramic artifacts, 330 sherds form portions of vessel rims, necks, shoulders, and bodies individually or in various combinations. Thirty-one smoking pipe and pipe fragments and 47 juvenile manufactured ceramic vessel sherds were recovered, as well as an additional 13 miscellaneous ceramic objects.

A total of 17 ceramic sherds could be classified according to the typology used by MacNeish (1952), Ridley (1952) and Wright (1966). The sample consists of 17 identified vessels representing five different types: Pound Necked, Black Necked, Lalonde High Collar, and Lawson Incised and Lawson Opposed. In addition, eight pipe fragments representing two different decorative motifs, Iroquois Ring and Plain Trumpet were identified in the Stage 3 assemblage. Catalogues of the assemblage and supplementary data are provided in Appendices B through E.

Table 13: Ceramic Artifacts

Type	N	%
Unanalyzable Fragments	1567	78.82
Base Fragments	1	0.05
Body Fragments	129	6.49
Castellation Fragment	2	0.10
Neck Fragments	63	3.17
Rim Fragments	98	4.93
Neck and Shoulder Fragments	24	1.21
Shoulder Fragments	13	0.65

Pipe Fragments	30	1.51
Pipe	1	0.05
Misc. Ceramic Artifacts	13	0.65
Total	1,988	100

A total of 61,292 ceramic artifacts was recovered during the Stage 4 excavations (Table 14).

Of these, 9,914 fragments form portions of vessel rims, necks, shoulders and bodies, individually or in various combinations. An additional 126 fragments are identified as miscellaneous manufacturing objects. The sample includes 49,932 sherds that are too small or exfoliated to be considered analyzable.

Four hundred and thirty-three smoking pipe fragments and 838 juvenile manufactured ceramic vessel and pipe fragments were also found. Both groups are discussed in detail below.

Whenever possible, all ceramic artifacts were mended prior to analysis to the minimum number by provenience.

Table 14: McNair Site – Stage 4 Ceramic Artifacts Assemblage

Sherd type	N	%
Unanalyzable sherd	49932	81.46
Body	5020	8.19

Total	61,292	100

3.2 Analysis of Ceramic Vessels

The combined Stage 3-4 ceramic vessel assemblage consists of 581 identified vessels, 2,535 unanalyzable rim fragments, 1341 neck fragments, 380 shoulder fragments, 38 neck/shoulder fragments, 12 neck/shoulder/body fragments, five shoulder/body fragments, one base fragment and 5,020 body fragments. Ceramic fragments smaller than 24 millimetres or displaying excessive exterior exfoliation were regarded as unanalyzable. They account for 49,932 fragments, 81.46% of the total ceramic assemblage. A complete catalogue of the ceramic rim sherds is provided in Appendices B and C.

3.3 Methods

The present discussion utilizes attribute and typological approaches outlined by Emerson (1968), MacNeish (1952), Ridley (1952), Smith (1983) and Wright (1966) in order to facilitate inter- and intra-site comparative studies.

The attribute analysis included, if possible, measurement of collar height, lip thickness and collar base thickness as well as description of decorative motif and technique on the interior, lip, collar, neck and shoulder. Furthermore, body sherds were examined for their surface treatment, whereas shoulder sherds were grouped according to their types. Analytical data were then entered into a database file, which generated an artifact catalogue and helped in attribute analysis.

For the typological analysis, only rim sherds were considered. A set of combined features (rim profile and decorative attributes) creates a type that may reflect temporal and spatial relationships within and between ethnic groups (MacNeish 1952, Wright 1966). Rims were regarded analyzable if they exhibit interior and exterior surfaces, a lip and a sufficient portion of the outer collar-neck area to ascertain the decorative motif and associated attributes. In some cases, only upper portion of neck is present. In addition, several rims are collarless; therefore, the division between neck and rim often becomes arbitrary; it actually appears that the rim motif is repeated on the neck area. The data recorded for the typological analysis are helpful for comparison of the McNair site with neighbouring sites.

3.4 Vessel Rims: Attribute Analysis Results

Tables 15 and 16 provide a summary descriptive statistics of individual attributes. Forty two vessels are represented by castellation fragments only and are not included in the following discussion. Additionally, a single vessel with unique attributes is treated separately and is also not incorporated in group analysis.

The majority of the rims are generally characterized by a well-developed collar (85.69%), while 13.57% of the assemblage have an incipient collar. Only four vessels are collarless. A rounded base shape is associated with 80.86% of the sample, while angular bases are present on 18.4%. The collar height ranges between 4.15 mm and 35.21 mm with an average of 13.39 mm and a standard deviation of 4.52 mm. The basal collar width ranges from 3.94 mm to 20.45 mm with a mean of 9.14 mm and a standard deviation of 2.29 mm. Six Lalonde High Collared vessels were excluded from the above descriptive statistics, because of their unique high collars.

Most vessels display a rounded lip form (76.95%). The lips on the rest of the vessels are flat (20.45%), concave (1.67%), irregular (0.74%) and pointed (0.19%). The angle of lip to interior is mostly obtuse (96.1%) and is followed by right (2.6%) and acute (1.3%). Lip thickness ranges between 0.7 mm and 10.4 mm with a mean of 4.35 mm and a standard deviation of 1.44 mm.

Rim vessels are primarily outflaring (98.14%), while nine specimens are vertical and only one is insloping.

The proportions of convex, straight and concave interior collar profiles are: 68.59%, 18.21%, and 12.45%, respectively. Additionally, three vessels display interior profiles of convex over concave and one specimen exhibits a profile of concave over convex over concave. The exterior profiles of the vessels are convex (50%), concave (31.97%), straight (17.65%) and concave over convex (0.38%).

The interiors of the vessels are usually plain (76.21%). Decorative motifs present on collar interiors are oblique (n=112) followed by vertical (n=9), punctate (n=5), opposed (n=1) and crescent-shaped (n=1). Linear stamping is the most common technique used for decorating the interior (n=117). Other techniques include punctate (n=5), dentate stamping (n=4) and incising (n=2).

In most cases, lips are plain (93.87%). The rest are decorated with obliques (n=20) and horizontal (n=1). Notches are present on 12 specimens. The techniques used in decorating lips include linear stamping, notching and incising.

Thirty-eight different collar motifs were identified within the assemblage (Table 17). In general, the ceramic assemblage includes a great variety of decorative motifs and techniques. The most common collar motifs includes: oblique (62.63%), vertical (9.47%), plain (5.95%), opposed (5.95%), oblique crossed by oblique (2.22%) and horizontal (2.22%). The rest of vessels include a combination of various motifs. The most common collar techniques are incising (69.33%) and linear stamping (13.01%). There are also 32 plain collars. The remaining vessels exhibit a combination of techniques.

Necks are predominantly plain (52.79%) or display decorative motifs characterized by horizontal (14.68%), oblique (13.57%) and horizontal over oblique (7.06%). In addition, there are opposed (2.96%), horizontal over opposed (2.04%) and oblique over horizontal (1.49%). The remaining 29 vessels display 18 different neck motifs accounting for 5.41% of the sample (Table 18).

3.5 Vessel Rims: Typological Analysis Results

Table 19 provides an overview of specific ceramic vessel types classified according to the typology used by MacNeish (1952), Ridley (1952) and Wright (1966). The sample consists of 539 identified vessels representing 16 different types.

Table 19: McNair Site – Ceramic Vessel Types

3.5.1 Huron Incised

Two hundred and thirty-three rims, representing 43.23% of the total of vessel assemblage were classified as Huron Incised (Plates 8-11). These vessels exhibit convex (n=178), straight (n=52) and concave (n=3) interior profiles. All have outflaring rim profiles. The majority of rims have well-defined collars (n=211), although, an incipient collar is also present (n=22). Collar height ranges from 5.78 mm to 28.78 mm with an average of 13.53 mm and a standard deviation of 4.24 mm.

Plate 8: A Huron Incised Vessel Cat.#3244

Plate 9: A Huron Incised Vessel Cat.#2882

Variability among the Huron Incised vessels (Table 20) predominantly relates to the collar motif, as neck decoration is limited to a band of mostly short obliques (gashes) or punctates on several specimens. The dominant decorative motif on collars is a single band of obliques, verticals or opposed on a developed collar with a plain neck, accounting for 77.25% of the assemblage. In addition, 58 vessels have interior decoration, five specimens have a lip decoration and two examples have both interior and lip decoration.

3.5.2 Black Necked

One hundred and eighty-seven vessels typed as Black Necked account for 34.7% of the total vessel assemblage (Plates 12-16). The majority of the interior profiles are convex (n=158), but straight (n=26) and concave (n=3) are also present. All vessels are outflaring. Most of them have a developed collar (87.2%), while the rest exhibit an incipient collar (12.8%). Collar height varies between 5.09 mm and 35.21 mm with a mean of 12.35 mm and a standard deviation of 4.5 mm.

Plate 13: A Partially Reconstructed Black Necked Vessel (Cat.#2871)

Plate 14: A Partially Reconstructed Black Necked Vessel (Cat.#2901 – not all fragments shown)

Table 21 shows the variation within the Black Necked type, utilizing rim form with collar and neck motifs. There are 59 variants observed within this type. The most common attribute combination encompasses obliques on a developed collar with neck motifs comprised of either obliques (16.04%), horizontals (13.36%), horizontals over obliques (12.83%) or opposed (5.34%). Fifty-four rims have an interior decoration, eight rims have a lip decoration and four exhibit both interior and lip decoration.

3.5.3 Pound Necked

Twenty-six vessels are identified as the Pound Necked, representing 4.82% of the total vessel assemblage (Plates 17-19). They display concave (n=23) and straight (n=3) interior profiles. Seventeen vessels have a developed collar, while nine examples exhibit an incipient collar. Collar height ranges from 9.56 mm to 30.98 mm with an average of 16.07 mm and a standard deviation of 4.8 mm.

Plate 17: A Partially Reconstructed Pound Necked Vessel (Cat.#2904).

Table 22 summarizes variability among the Pound Necked vessels on the basis of rim form and collar and neck decorative motifs. Thirteen different attribute combinations are identified by these means. Six vessels (23.07%) display obliques on a developed collar and horizontals on the neck. Five vessels (19.23%) have verticals on an incipient collar and horizontals on the neck. Interior motifs are restricted to three vessels. Lip motifs appear also on three examples.

Total			26	100

Plate 18: A Pound Necked Vessel (Cat.#3045 – not all fragments shown)

Plate 19: A Pound Necked Vessel (Cat.#3023)

3.5.4 *Niagara Collared*

Niagara Collared vessels comprise 4.27% of the total assemblage (Plate 20). They exhibit convex (n=11), concave (n=7) and straight (n=5) interior profiles. Twenty vessels have a developed collar, while only three have an incipient collar. Collar height varies between 9.63 mm and 26.64 mm with an average of 13.88 mm and a standard deviation of 4.17 mm. All vessels are undecorated. A single example of this type has a pointed castellation with a collared base (Cat.#3343).

Plate 20: A Niagara Collared Vessel (Cat.#3343)

3.5.5 *Lawson Incised*

The ceramic assemblage includes 19 vessels classified as Lawson Incised (Plate 21). Concave interior profile is identified on 18 specimens and a straight profile is present on one example. There are 16 cases of a developed collar and three of an incipient collar. Their height ranges between 8.57 mm and 24.97 mm with a mean of 15.4 mm and a standard deviation of 4.82 mm.

On the basis of rim form and collar and neck motifs, the predominant variant (73.69%) consists of vessels with obliques on a developed collar and a plain neck (Table 23). There is only one case of decorated neck. Interior decoration is restricted to four vessels and lip decoration is present on one example.

Table 23: McNair Site – Attribute Variability among Lawson Incised Type Vessels

Rim Form	Collar Motif	Neck Motif	n	%
Collared	Oblique	Plain	14	73.69
Incipient	Vertical	Plain	2	10.53
Collared	Oblique	Vertical	1	5.26
Collared	Oblique over Oblique	Plain	1	5.26
Incipient	Opposed (Right and Left)	Plain	1	5.26
Total			19	100

Plate 21: Selected Lawson Incised Vessels: Cat.#2886 (a), Cat.#2875 (b), Cat.#2864 (c)

3.5.6 *Warminster Horizontal*

Ten vessels are identified as Warminster Horizontal (Plate 22). They have convex (n=7) and straight (n=3) interior profiles. All examples have a well-developed collar with a height ranging from 10.76 mm to 22.13 mm (mean: 17.16 mm, standard deviation 3.45 mm).

Table 24 shows the variation within the Warminster Horizontal type, utilizing rim form with collar and neck decorative motifs. The number of horizontal lines on the collar varies between three and six. Interior decoration is limited to two vessels.

Table 24: McNair Site – Attribute Variability among Warminster Horizontal Type Vessels

Rim Form	Collar Motif	Neck Motif	n	%
Collared	Horizontal	Plain	3	30
Collared	Oblique over Horizontal	Plain	2	20
Collared	Horizontal over oblique	Plain	2	20
Collared	Horizontal	Oblique	2	20
Collared	Horizontal	Horizontal	1	10
Total			10	100

Plate 22: Selected Warminster Horizontal Vessels: Cat.#3068 (a), Cat.#3002 (b)

3.5.7 Lalonde High Collared

Six vessels are identified as Lalonde High Collared. They display the following interior profiles: convex over concave (n=3), convex (n=1), concave (n=1) and concave over convex over concave (n=1). Lip decoration is limited to two vessels. The collar and neck motifs with associated rim forms and collar height of the vessels is presented in Table 25.

Table 25: McNair Site – Attribute Variability among Lalonde High Collared Type Vessels

Rim Form	Collar Height	Collar Motif	Neck Motif	n	%
Collared	54.15	Horizontal over Opposed (Right, Left and Vertical) over Horizontal	Plain	1	16.67
Collared	74.01	Oblique over Oblique over Opposed (Horizontal and Vertical)	Plain	1	16.67
Collared	36.64	Opposed (Right and Left)	Plain	1	16.67
Collared	60.72	Opposed (Right and Vertical)	Plain	1	16.67
Collared	70.21	Opposed (Left and Horizontal)	Plain	1	16.67
Collared	56.76	Opposed (Right and Left and Vertical and Horizontal)	Plain	1	16.67
Total				6	100.02

3.5.8 Seed Incised

Four vessels are classified as Seed Incised (Plate 23). They have convex (n=2) and concave (n=2) interior profiles. Three vessels have an incipient collar and one has a relatively well-developed collar. The decoration on the exterior surface consists mainly of stamped obliques or verticals sometimes combined with plain bands. There is only one case of decorated neck with stamped verticals. There is neither lip nor interior decoration.

Plate 23: Selected Seed Incised Vessels: Cat.#4595 (a), Cat.#4609 (b), Cat.#4634 (c).

3.5.9 Ontario Horizontal

Three Ontario Horizontal vessels are identified within the assemblage. Of the three, two have straight interior profiles, one is concave. All examples have a developed collar. The exterior surface of two specimens is decorated with five incised horizontals followed by incised obliques on the neck. The third vessel has four incised horizontals over incised obliques on the collar and an undecorated neck. In all cases the interior is plain and lip decoration, in form of stamped obliques, is limited to one vessel.

3.5.10 Pound Blank

Two vessels are classified as Pound Blank. One of them has a straight interior profile and a poorly developed collar. The exterior surface is decorated with open triangles containing parallel incised lines, the neck has a single incised horizontal line. The second Pound Blank vessel has a concave interior profile and a well-developed interior profile. The exterior decoration includes incised obliques and verticals combined with stamped obliques forming a triangle. The neck, lip and interior are plain.

3.5.11 Middleport Criss-Cross

Two vessels are identified as the Middleport Criss-Cross type. One example has a concave interior profile and the exterior surface of its poorly developed collar is decorated with distinct criss-cross incisions followed by incised horizontals on the neck. The lip of this specimen is notched. The second vessel has a convex interior profile and its incipient collar is decorated with incised criss-cross motifs. Its neck, lip and interior are plain.

3.5.12 Ripley Plain

Two vessels were identified as Ripley Plain. In both cases, the interior profile is convex. Outflaring collarless rims are plain as are the lips and interiors.

3.5.13 Sidey Notched

Two vessels are classified as Sidey Notched (Plate 24). One specimen has a concave interior profile and an incipient collar with incised obliques. The other example has a straight interior profile and a developed collar with incised obliques. Its neck is decorated with stamped obliques. In both instances, the lip is decorated with stamped obliques.

Plate 24: A Sidey Notched Vessel (Cat.#2910 – not all fragments shown)

3.5.14 Middleport Oblique

Two vessels are identified as Middleport Oblique. One example has a concave interior profile and a developed collar with stamped obliques over incised horizontal. The neck is decorated with incised horizontals. The other example has a straight interior profile and an incipient collar with incised oblique over incised horizontal. The neck is plain. In both cases, interior and lip are plain.

3.5.15 Untyped Vessels

Seventeen vessels exhibit motifs and shapes that do not correspond with any established types (Plates 25 and 26). The interior profiles are mostly convex (n=9) followed by concave (n=5) and straight (n=3). Table 26 summarizes variability among these vessels on the basis of rim form and collar and neck decorative motifs. The exterior surface of the collar is very often plain, but is accompanied by a decorated neck. In five instances, the lip is notched. Interior decoration is restricted to one vessel.

Plate 25: A Miscellaneous Vessel (Cat.#3374 – not all fragments shown)

Table 26: McNair Site – Attribute Variability among Miscellaneous Vessels

Rim Form	Collar Motif	Neck Motif	n	%
Collared	Plain	Oblique	4	23.53

Total			17	100.00

Plate 26: Selected Miscellaneous Vessels: Cat.#3361 (a), Cat.#3369 (b), Cat.#4605 (c), Cat.#3366 (d), Cat.#3368 (e), Cat.#3367 (f).

3.5.16 Unknown Vessel

A single example of an unknown type vessel has a plain convex interior profile and a plain rounded lip (width: 3.14 mm) (Plate 27). This outflaring and collarless vessel is decorated with a unique motif. Incised obliques are placed on the exterior surface and continue onto the neck, shoulder and body. The area between the obliques is decorated with a chevron motif (obliques merging with obliques or horizontal).

Plate 27: Unknown Vessel (Cat.#4593)

3.5.17 Castellations

Fifty-two castellations were recovered from the McNair site (Plates 28 and 29). Forty-two are isolated fragments, while the remaining ten are associated with the analyzed vessels.

Table 27: McNair Site – Castellation Attributes Lip Form Shape

Lip Form Shape	n	%
Pointed	31	59.62
Multiple Pointed	9	17.31
Rounded	6	11.54
Scalloped	5	9.61
Multiple Rounded	1	1.92
Total	52	100

As presented in Table 27, the vast majority of the castellations have pointed lips (59.62%). These are followed by multiple pointed (17.31%), rounded (11.54%), scalloped (9.61%) and multiple rounded (1.92%). The castellation base form is usually collared (48.08%), sometimes slightly overhanging (19.23%) and overhanging (9.61%). An incipient collar is observed in 21.15% of all castellations; the base form for one castellation could not be determined.

Plate 28: A Multiple Pointed Castellation (Cat. #3108 – not all fragments shown)

The division between scalloped forms and multiple forms is based on the width of spacing. Scalloped castellations are closely-spaced, while multiple pointed or rounded are more widely-spaced (Emerson 1955). An additional observation was made regarding the scalloped castellations. Specimens Cat.#2895, Cat.#3443 and Cat.#3444 appear to be made by the same potter. They exhibit the same decorative motif and technique as well as rim form; although, judging by use wear, they differed in their functions.

Table 28 displays 52 different combinations of collar and neck motifs with associated rim form shape found on castellations. Pointed castellations combined with oblique motifs on a collar and an undecorated neck dominate the sample.

Table 28: McNair Site – Castellation Attributes Lip Form Shape with Collar and Neck Motif

Lip Form Shape	Collar Motif	Neck Motif	n	%
Pointed	Oblique	Plain	14	26.93
Multiple Pointed	Oblique	Plain	5	9.62

Plate 29: Selected Castellations: Cat.#3279 (a), Cat.#4619 (b), Cat.#3275 (c), Cat.#3037 – not all fragments shown (d).

3.6 Neck Sherds

One thousand three hundred and ninety-one neck sherds that are not associated with identified vessels were recovered. More than half of these sherds (58.73%) appear to be plain, the rest display a decorative motif of some form (Plate 30).

Plate 30: Neck/Shoulder Fragment (Cat.#85)

3.7 Shoulder Sherds

A total of 435 shoulder sherds that are not associated with identified vessels display distinctive attributes with respect to form and decoration (Plate 31). Table 29 summarizes all the shoulder fragments that exhibit accurate type and motif data. It should be noted that plain rounded shoulders are likely underrepresented due to the difficulty of distinguishing them from body sherds.

Table 29: McNair Site – Shoulder Attributes, Type and Decorative Motif

Shoulder Type	Technique/Decoration	n	%
Rounded	Linear Stamped Oblique	205	47.12
Rounded	Plain	147	33.79
Carinated	Plain	20	4.6

Carinated	Incised Oblique	1	0.23
Total		435	100

Plate 31: Shoulder Fragments: Cat.#537 (a) and Cat.#131 (b)

3.8 Body and Base Sherds

Five thousand and thirty-seven body sherds were considered analyzable. They can be sorted into two main groups: smoothed undecorated sherds accounting for 94.18% of the total of body fragments and those showing evidence of a surface treatment or of having been decorated. The most common surface treatment is smoothed over ribbed paddle (n=75) followed by smoothed over cord-wrapped paddle (n=7) and smoothed over check-stamped (n=1). A number of body sherds (n=206) display elements of decorative motif generally associated with a shoulder; although, different motifs are also present

A single fragment is identified as a vessel base with a smoothed exterior.

3.9 Rim Fragments

In addition to identified vessel rims, 2,535 rim fragments are present in the ceramic sample. Due to their fragmentary nature, they do not provide reliable data.

3.10 Intra-site Distribution of Ceramic Vessels

Table 30 displays the distribution of traditional types by major provenience units.

Unfortunately, the intra-house sample is not sufficiently substantial to be used to suggest any meaningful interpretations in chronology or site sequence. Furthermore, since there are no ceramic vessel mends between different features or middens, it is difficult to determine any measure of contemporarily within the site.

Table 30: McNair Site – Ceramic Types by Major Provenience Units (n=528)

Type	H1	H2	H3	H4	H5	H6	H7 or H8	M1	M2
Huron Incised	3		1	4		2	4	213	2
Black Necked		2	1	3	1	2	2	175	
Pound Necked				1	1			24	
Niagara Collared								22	
Lawson Incised				1			1	14

23	117	Exterior	

3.11 Ceramic Smoking Pipes

The following discussion utilizes attribute and typological approaches outlined by Smith (1997) and Emerson (1967). Analysis of pipes and bowls included, if possible, measurement of bowl lip thickness, orifice diameter, mouth thickness, bore hole diameter and description of decorative motif, decorative technique, bowl form and stem form.

The McNair site ceramic smoking pipe assemblage consists of 433 fragments. Pipe stem, elbow and mouthpiece fragments represent of 50.58% of the assemblage, while bowl fragments account for 47.34% (Table 32).

Table 32: McNair Site – Pipe Assemblage

Condition	n	%
Stem Fragment	140	32.33
Unidentifiable Bowl Fragment	140	32.33
Identifiable Bowl Fragment	65	15.01
Stem with Mouthpiece	32	7.39
Elbow Fragment	26	6.01
Mouthpiece Fragment	10	2.31
Stem and Elbow Fragment	10	2.31
Indeterminate	9	2.08
Stem with Mouthpiece to Elbow	1	0.23
Total	433	100

Surface treatment was recorded for 394 fragments. Surface burnishing, in varying degrees, is present on 285 fragments. One hundred and nine pipe fragments display evidence of smoothing. Surface treatment could not be determined for 26 specimens. Four pipe fragments appear to be untreated and rough.

3.11.1 Bowls

Two main forms of pipe bowl dominate the pipe assemblage: barrel and trumpet forms. The identified smoking pipe types include: Iroquois Ring (56.92%), Trumpet Plain (16.92%), Apple Bowl Plain (6.15%), Conical Ring (4.61%) and Conical Plain (3.08%). There are also single examples of Trumpet Decorated, a miniature pipe and an effigy. Five pipe bowls remain untyped (Table 33). A large proportion of the bowl pieces could not be classified due to their fragmentary nature (68.29% of the total of pipe bowls).

Table 33: McNair Site – Ceramic Smoking Pipe Types

Bowl Type	n	%
Iroquois Ring	37	56.92
Trumpet Plain	11	16.92
Miscellaneous	5	7.69
Apple Bowl Plain	4	6.15
Conical Ring	3	4.61
Conical Plain	2	3.08
Trumpet Decorated	1	1.54
Miniature	1	1.54
Effigy	1	1.54
Total	65	99.99

3.11.1.1 Iroquois Ring

The 37 bowl fragments identified as the Iroquois Ring type exhibit 13 different decorative motifs (Plate 32, Table 34). The lip thickness varies between 1.34 mm and 5.84 mm with a mean of 2.85 mm and a standard deviation of 0.96 mm. A bowl diameter was obtained for seven specimens and ranges between 20.74 mm and 28.57 mm. An orifice diameter was also measured and varies from 16.86 mm to 24.15 mm. Bowl height was measured for five pipes and ranges between 45.06 mm and 52.96 mm. Three pipe bowls display evidence of being covered with a red ochre (Cat.#3685, Cat.#3799 and Cat.#3851). Table 34 presents detail decorative attributes recorded on the exterior surface.

Plate 32: Selected Iroquois Ring Pipes: Cat.#3690 (a), Cat.#3700 (b), Cat.#3687 (c), Cat.#3851 (d), Cat.#3799 (e), Cat.#3779 (f)

3.11.1.2 Trumpet Plain

Eleven bowl fragments identified as the Trumpet Plain show evidence of having been burnished (Plate 33). Metrical data is restricted only to the lip thickness and varies between 0.97 mm and 3.7 mm with an average of 2.70 mm and a standard deviation of 0.76 mm.

Plate 33: Selected Plan Trumpet:
Cat.#3806 (a) and Cat.#3692 (b)

3.11.1.3 Apple Bowl Plain

Four pipe bowls are classified as Apple Bowl Plain. Three of them have a slightly burnished exterior surface, while one shows evidence of having been smoothed. The lip thickness was obtained for all of them and ranges between 3.14 mm and 5.52 mm.

3.11.1.4 Conical Ring

The ceramic pipe assemblage includes three examples of Conical Ring. The lip thickness measurements are 2.53 mm, 2.80 mm and 2.86 mm. The exterior surface on two specimens is slightly burnished and on one example is smoothed. Two pipes are decorated with two or three incised horizontals, while the remaining one has four incised horizontals above a row of punctuates.

3.11.1.5 Conical Plain

Two pipe bowls are identified as Conical Plain. The lip thickness is 5.45 mm and 5.56 mm. The exterior surface of both specimens had been smoothed. One example has a flared lip.

3.11.1.6 Trumpet Decorated

A single example of a Trumpet Decorated pipe has a burnished exterior surface. The lip thickness is 6.11 mm. The decoration consists of notches placed on the lip.

3.11.2 Miniature Pipe

An almost complete pipe is classified as a miniature. The bowl diameter and orifice diameter are 11.81 mm and 8.56 mm, respectively. The bowl height is 16.31 mm and the lip thickness is 1.54 mm. The mouthpiece is missing. The exterior surface has been smoothed and the decorative motif includes a string of punctuates placed below the lip (Plate 34).

Plate 34: A Miniature Pipe (Cat.#4667)

3.11.3 Effigy

A single incomplete effigy pipe was recovered. The exterior surface had been burnished and decorated with two incised horizontals and a row of punctates. The form of the effigy cannot be determined.

3.11.4 Miscellaneous

Three out of five untyped pipe bowls have a smoothed exterior surface. The remaining two pipes have a slightly burnished exterior surface. Three specimens appear to be plain while two examples had been decorated with incised horizontals or obliques. The lip thickness varies from 3.35 mm to 7.85 mm.

3.11.5 Elbows and Stems

Two hundred and nine elbow and stem fragments were recovered. One hundred and twenty-three fragments are either burnished or slightly burnished, 65 specimens are smoothed. Three examples are untreated and rough, while the surface treatment for 27 pieces is not available. Forty-six stem fragments are sufficiently complete to determine the profile. Two cross section shapes are present in the sample: oval (n=43) and circular (n=3). Ten fragments bear an evidence of having been painted with red ochre.

3.11.6 Mouthpieces

Recovered mouthpieces are primarily tapered (88.57%), while the rest have been ground. Twenty-eight of the thirty-five mouthpieces are sufficiently complete to provide data on borehole diameters, which range from 2.69 mm to 6.31 mm, with a mean of 4.09 mm and a standard deviation of 0.79 mm.

3.12 Intra-Site Distribution of Ceramic Pipes

The majority of pipe fragments were recovered from Midden 1 (Table 35). The rest are associated with features and Midden 2. Of those excavated from houses, 61.54 % was recovered from House 4: Feature 122 (n=3), Feature 181 (n=2), Feature 179 (n=1), Feature 196 (n=1) and Feature 197 (n=1). Post moulds in House 6 yielded two Iroquois Ring pipes.

Table 35: McNair Site – Distribution of Smoking Pipe Fragments among the Houses and Middens

Macro Location	n	%
House 1	1	0.23
House 2	1	0.23
House 4	8	1.84
House 6	2	0.46
House 7 or 8	1	0.23
Midden 1	416	95.85
Midden 2	5	1.15
Total	434	99.99

Single pipe fragments were recovered from Feature 35 in House 1, Feature 75 in House 2 and Feature 256 in House 7 or 8. Table 36 presents the distribution of ceramic smoking pipe types among the houses and midden. A single Iroquois Ring pipe mends between a post mould in House 6 (725-275:3691) and Midden 1 (725-253:3842).

Table 36: McNair Site – Distribution of Ceramic Smoking Pipe Types among Houses and Middens

Type	House 2	House 4	House 6	House 7 or 8	Midden 1
Iroquois Ring	1	3	2		31
Trumpet Plain				1	10
Apple Bowl Plain					4
Conical Plain					3
Conical Ring					2
Trumpet Decorated					1
Effigy					1
Miniature Pipe					1
Untyped					5

3.13 Juvenile-Manufactured Ceramic Vessels and Pipes

Eight hundred and thirty-eight ceramic artifacts were identified as ceramic vessels and pipes manufactured by juveniles. The criteria used to distinguish the juvenile assemblage from the adult ceramics comprise the crudeness of form, size as well as decorative motifs and techniques. Catalogues of the assemblage and supplementary data are provided in Appendices F through H.

Table 37: McNair Site – Juvenile Ceramic Artifacts

Type	n	%
Unanalyzable Rim Fragments	251	29.95
Identified Vessels	184	21.96
Body Fragments	127	15.16
Neck-Shoulder Fragments	77	9.19
Neck Fragments	59	7.04
Shoulder Fragments	47	5.61
Pipe Fragments	47	5.61
Indeterminate	42	5.01
Neck-Shoulder-Body Fragments	4	0.47
Total	838	100

The juvenile ceramic assemblage consists of 251 unanalyzable rim fragments, 184 identified vessels, 127 body sherds, 77 neck/shoulders sherds, 59 neck sherds, 47 shoulder sherds and four neck/shoulder/body sherds (Table 37). There are also 47 pipe fragments and 42 pieces that could not be identified.

3.13.1 Juvenile Vessel Rims

Juvenile rims were analyzed using only an attribute approach (Plates 35-38). They were regarded analyzable if they exhibited interior and exterior surfaces, a lip, and a sufficient portion of the exterior collar-neck area to identify the decorative motif and associated attributes. The rim sample was sorted and mended into 184 individual vessels. Summary descriptive statistics of individual attributes are presented in Table 38. Three vessels are represented by castellation fragments only and are not included in the following discussion.

The majority of the rims are generally characterized by poor collar development. More than half of the assemblage is incipiently collared (58.56%), while 22.1% of the vessels are collarless. Only 19.34% of the vessels have a developed collar. Collar base shape is mostly rounded (75.14%), the base of one collar is angular and three examples have an irregular collar base shape. The collar height ranges between 3.71 mm and 36.3 mm with an average of 11.38 mm and a standard deviation of 4.44 mm. The basal collar width ranges from 3.81 mm to 13.89 mm with a mean of 7.03 mm and a standard deviation of 1.82 mm.

Most vessels display a rounded lip form (84.53%). The lips on the rest of the vessels are flat (6.63%), irregular (6.08%) and pointed (1.66%). The lip form on two specimens could not be determined. The angle of lip to interior is mostly obtuse (90.61%) followed by acute (7.18%). In four cases the angle of lip to interior could not be determined. Lip thickness ranges between 1.15 mm and 9.77 mm with a mean of 4.13 mm and a standard deviation of 1.47 mm.

Rim orientation is primarily outflaring (95.58%), but insloping (n=5) and vertical (n=3) also occur.

Plate 35: A Reconstructed Juvenile Vessel (Cat.#4489)

Interior profiles are convex (68.51%), concave (17.13%), straight 7.73%) and irregular (6.08%). The interior profile for a single example could not be determined. Exterior profiles are convex (73.48%), concave (13.26%), irregular (11.60%) and straight (0.55%). The exterior profile for a single example could not be determined.

Out of all juvenile vessels, 97.79% have a plain interior. Three specimens bear interior decoration of incised obliques, one has punctates. Most vessels display a plain lip (87.30%). The rest are decorated with incised obliques (9.39%) and notches (2.76%). The decorative motif and technique could not be determined for one example.

Tables 39 and 40 summarize decorative attributes on the exterior surface of the collars and necks. In general, juvenile ceramic assemblage includes a great variety of decorative motifs and techniques. There are 47.51% plain collars, the rest of vessels displays 31 various motifs with obliques the most popular (33.7%). Plain (47.51%) and incising (38.12%) are the most common techniques observed on collars.

The exterior surfaces of the necks tend to be plain (71.82%). Oblique elements alone or combined with other components are the next most popular motifs. Neck decoration was accomplished largely through incising.

As previously indicated, almost half of juvenile vessels are plain, and rest appear to be poorly decorated, yet it is still possible to make a few interesting observations regarding decorative patterns. Superficial examination based on the pot manufacture and decoration suggests that young potters tended to copy adult pots. In some cases, even distinct types can be recognized among juvenile vessels (Plates 35 and 38).

Plate 38: Selected Juvenile Vessels: Cat.#4369 (a), Cat.#4490 (b), Cat.#4486 - not all fragments shown (c), Cat.#4487 (d)

3.13.2 Neck Fragments

One hundred and forty neck fragments are identified in the assemblage either as isolated fragments or in a combination with the shoulder and body. Eighty-eight neck fragments are plain, 52 neck pieces are decorated.

3.13.3 Shoulder Fragments

One hundred and twenty-eight shoulder fragments are identified in the assemblage either, as isolated fragments or in a combination with the neck and body. Almost all shoulder fragments are rounded with an exception of two angular examples and one that could not be determined. There are 64 decorated shoulder fragments and 64 plain shoulder fragments.

3.13.4 Body Fragments

Out of 131 body fragments, 91 sherds are plain, 37 display an evidence of having been decorated and two are been smoothed over ribbed paddle. The surface treatment could not be determined for one body fragment. Three body fragments include a base. A single body fragment is stained with red ochre (Cat.#4231). Another example exhibits well-preserved finger prints (Cat.#4127).

3.13.5 Rim Fragments and Castellations

In addition to identified vessel rims, 251 rim fragments are included in the juvenile ceramic sample. Two of them display fingernail impressions.

Three vessel rims are represented only by the castellation. One specimen is rounded and plain; another one is rounded and decorated with incised obliques. Finally, the shape for one castellation could not be determined; however, it appears to be plain and has an overhanging collar.

3.14 Juvenile Ceramic Smoking Pipes

The juvenile ceramic pipes recovered from the McNair site consist of 27 bowl fragments and 20 stem and mouthpiece fragments (Plate 39). Out of all pipe bowls, 20 fragments represent identified bowls. They are generally plain with an exception of two decorated with incised verticals. The surface treatment on eighteen examples is smoothed, while two specimens remain untreated. The exterior bowl orientation is mostly outflaring (n=14) followed by insloping (n=3) and vertical (n=2). Bowl and orifice diameters were obtained only for one specimen: 33.26 mm and 15.35 mm respectively. The seven remaining pipe bowls are unidentified.

Two elbow fragments are plain and smoothed. All stem and mouthpiece fragments are also plain and smoothed. Three of them do not have a bore hole. Bore diameter could be measured for four specimens and ranges from 2.10 mm to 3.37 mm.

Plate 39: Selected Juvenile Pipes: Cat.#4538 (a), Cat.#4517 (b), Cat.#4526 (c)

3.15 Intra-Site Distribution of Juvenile Ceramics

Table 41 outlines the distribution of juvenile ceramic vessels and pipes among the major provenience units. Juvenile ceramics were mostly recovered from Midden 1 (98.2%). The rest were distributed among four longhouses and Midden 2.

Table 41: McNair Site – Distribution of Juvenile Ceramic Vessels and Pipes

Macro Location	n	%
Midden 1	814	98.2
House 7 or 8	5	0.6
Midden 2	4	0.48
House 6	3	0.36
House 4	2	0.24
House 5	1	0.12
Total	829	100

3.16 Miscellaneous Manufacturing Objects

The miscellaneous ceramic objects consist of 176 pieces of manufacturing waste, fired and unfired clay. The fragments identified as manufacturing waste of fired/unfired clay display irregular, untreated surfaces that do not have any apparent form or function. They are either untempered or poorly tempered. Ten rolled ceramic objects are identified as coil fragments; both fired and unfired. Three fired clay lumps display fingerprints, while a single fragment appears to be flattened on both sides. There are also two undecorated handle fragments (Plate 40).

In general, miscellaneous artifacts were found mostly in Midden 1. Four unfired and untempered artifacts were recovered from features in House 4. Eleven other miscellaneous artifacts are associated with exterior features.

Plate 40: Selected Miscellaneous Objects: Cat.#1650 (a), Cat.#400 (b), Cat.#2461 (c), Cat.#2163 (d), Cat.#775 (e)

3.17 Chronological Trends

The ceramic assemblage represents a great range of vessel types. It appears that the site is dominated by Huron Incised (43.23%) and Black Necked (34.7%) types. A broad assortment of types distinguishes the McNair site from some neighbouring sites; however, when sample size is considered, the apparent difference in richness is reduced. The results of typological analysis for the McNair site and other Iroquoian sites within the West Don River watershed are presented in Table 42. One striking difference among these six sites is the high frequency of Huron Incised at McNair, whereas, the assemblages from neighbouring sites are dominated by higher frequencies of Black Necked. This may place the McNair site relatively late in the chronological sequence.

Table 42: Ceramic Types – Comparison of Localized Iroquoian Sites

Type	McNair Site (AlGu-8)		Murphy Goulding/Orion Site (AlGu-3/45)		Walkington 2 Site (AlGu-341)		Baker Site (AkGu-15)		McGaw Site (AlGu-88)		Somme Site (AlGu-239)

Table 43 utilizes classification system established by Lennox and Kenyon (1984) in order to compensate for the problems generally encountered when dealing with type definitions described by multiple authors. This suggests little difference in the temporal placement between the Murphy-Goulding-Orion and McNair site.

Classifications:

Class 1, Ontario Horizontal, Iroquois Linear.

Class 2 Middleport Oblique, Pound Necked, Black Necked, Middleport Criss-Cross.

Class 3 Lawson Incised, Huron Incised, Lawson Opposed, Sidey Crossed, Warminster Horizontal, Sidey Notched, Copeland Incised, Pound Blank and Warmister Crossed.

Class 5 Lalonde High Collar.

Class 6 Seed Incised, Ripley Plain, Ripley Collared, Niagara Collared.

Class 4 and 7 not used.

Table 44 summarizes the general trends in pipe bowl (Dodd, et al. 1990; Lennox and Fitzgerald 1990). Pipe forms which appeared on Ontario sites during the later Middle Iroquoian period include conical with horizontals or complex zoned incising as well cylindrical plain or cylindrical with horizontals. In addition, the most common shape, conical usually made up half of the assemblage. Other pipe bowl shapes such as vasiform and trumpet appeared in the late Middle Iroquoian times (Dodd, et al. 1990). At McNair, there is an absence of coronet and collared pipe forms which are generally associated with sixteenth and seventeenth century sites (Lennox and Fitzgerald 1990; Noble 1992; Ramsden 1990).

Table 44: Chronological Trends in Pipe Bowl Form

Cent.	Conical	Barrel	Trumpet	Vasiform	Short Barrel	Coronet	Collared	Effigy	Miniature

4.0 LITHIC ARTIFACT ANALYSIS

Andrea Carnevale

4.1 Introduction

A total of 7,314 lithic artifacts was recovered from the Stage 3-4 investigation of the site, comprising formal and informal flaked tools as well as the by-products of stone tool manufacture. The flaked stone artifacts include 76 formal tools (1.04% of the total flaked lithic assemblage) and 7,238 pieces of debitage (98.96%). Raw materials included: Onondaga (n=7,298, 99.8% of the collection), Lockport (n=6, 0.08%), quartz (n=2, 0.03%) and unidentifiable material (n=2, 0.03%). A complete catalogue of all flaked lithic artifacts from the McNair site is presented in Appendix I.

A total of 76 formal flaked lithic tools was recovered during the 2003-2004 field seasons (Table 45), of which 20 could be attributed to known temporal/cultural periods.

Table 45: The McNair Flaked Lithic Assemblage

Shatter	4802	65.65
Total	7,314	100%

4.2 Projectile points

Fifteen complete projectile points and 11 projectile point fragments were recovered from the site. All but four projectile points (recovered from the Stage 3 CSC and from Features 58 and 78) were recovered from Midden 1 excavation units. They have all been manufactured from Onondaga chert and are characterized by complete bifacial flaking.

The oldest recovered specimen is a Middle Archaic Brewerton side-notched (ca. 4,000-2,500 B.C.) projectile point (Cat.# 0.01219). The point was recovered during the Stage 3 CSC and has the following dimensions: total point length, 35.7mm; blade length, 25.5mm; blade width, 16.4mm; blade thickness, 4.9mm; internotch width,

13.8mm; stem length, 10.2mm; stem width, 21.3mm; and stem thickness, 4.1mm. The base has been thinned, ground and is slightly concave. The right margin of the blade has been retouched to a slightly serrated edge.

A complete Late Archaic Crawford Knoll (ca. 1,300-900 B.C.) projectile point, recovered from Midden 1 Unit 719-249 (Plate 41, Cat.#L799), has the following dimensions: total point length, 25.2 mm; blade length, 20.2mm; blade width, 9.4mm; blade thickness, 4.5mm; stem length, 6.5mm; stem width, 11.4mm; internotch width, 8.0mm; and stem thickness, 3.3mm. Both lateral edges have been retouched to a slightly serrated edge. The base is convex and has been thinned.

Plate 41: Select Projectile Points: Top row (left to right) Cat.#L17, Cat.#L479 and Cat.#L703. Bottom row (left to right) Cat.#L799, Cat.#L1088 and Cat.#L1068

One corner-notched projectile point (Plate 41, Cat.#L479), missing its distal end and one of its barbs, was recovered from Unit 714-246 in Midden 1. This point likely represents a reworked Archaic period point form. It has the following dimensions: point length, 30.5mm; blade width, 23.2mm; blade thickness, 5.6mm; stem length, 7.4mm; stem width, 12.0mm; internotch width, 11.5mm; stem thickness, 3.5mm; and tang height, 3.0mm. Its base is slightly convex.

A reworked projectile point with a double notch on the left margin was recovered during the Stage 3 CSC (Cat. #0.1127). The point has the following dimensions: total point length, 28.2 mm; blade length, 17.9 mm; blade width, 15.6 mm; blade thickness, 3.2mm; stem length, 10.3 mm; stem width, 16.8 mm; internotch width, 12.0 mm; and stem thickness, 3.1 mm. Both lateral edges of the blade have been retouched and the tip of point has been reworked and likely used as a perforator or borer. The base is straight and has been snapped.

Two complete Nanticoke Triangular projectile points (AD 1300-1600) were recovered. The first, recovered from an ash pit feature (Feature 58 south-west quad) within the House 1 North Exterior Activity Area, is fashioned from a primary thinning flake and has the following dimensions: total point length, 25.8mm; width, 18.5mm; and thickness, 3.4mm (Plate 41, Cat.#L17). The base is straight and has been thinned. The blade has a prominent medial ridge, however the base shows no evidence of being worked as the ventral surface exhibits percussion ripples and dorsal scars are present on the obverse side.

The second point (Plate 41, Cat.#L703), which was recovered from Midden 1 Unit 717-261, has the following dimensions: total point length, 22.8 mm; width, 12.8 mm; and thickness 3.4 mm. Its base is slightly concave and has been thinned. Both lateral edges of the blade have been retouched.

Nine Nanticoke Notched projectile points (ca. 1400 - 1600 A.D.), two complete and seven missing either their tip or a portion of their tangs are also included in the assemblage. The first complete specimen (Plate 41, Cat.#L1068) was recovered from Unit 723-250 in Midden 1. It has the following dimensions: total point length, 31.4mm; blade length, 22.8mm; blade width, 10.0mm; blade thickness, 4.3mm; stem length, 6.2 mm; stem width, 14.0mm; internotch width, 10.1mm; stem thickness, 3.7mm; and tang height, 7.8 mm. This point exhibits evidence of hafting and prehensile wear on the stem.

The second specimen (Plate 41, Cat.#L1088), also complete, was recovered from Unit 723-258 in Midden 1. It has the following dimensions: total point length, 39.4mm; blade length, 29.5mm; blade width, 11.3mm; blade thickness, 5.5mm; stem length, 9.7mm; stem width, 14.5mm; internotch width, 8.5mm; stem thickness, 3.3mm; and tang height, 5.1mm. This point exhibits evidence of hafting and prehensile wear on the stem.

The third specimen (Cat.#L27), missing a portion of one of its tangs, was recovered from Feature 78 in House 2 and has the following dimensions: total point length, 25.4mm; blade length, 17.7mm; blade width, 8.8mm; blade thickness, 4.0mm; stem length, 5.5mm; stem width, 7.9mm; internotch width, 7.9mm; stem thickness, 4.0mm; and tang height, 4.6mm. It exhibits evidence of hafting.

The fourth specimen (Cat.#L220), missing its tip, was recovered from Midden 1 Unit 709-252. The point has the following dimensions: total point length, 25.3mm; blade length, 15.7mm; blade width, 10.2mm; blade thickness, 3.1mm; stem length, 6.5mm; stem width, 15.6mm; internotch width, 7.6mm; stem thickness, 3.1mm; and tang height, 6.0mm.

The fifth specimen (Cat.#L336), missing its tip, was recovered from Unit 712-243 in Midden 1 and has the following dimensions: total point length, 35.5mm; blade length, 25.6mm; blade width, 12.4mm; blade thickness, 4.3mm; stem length, 8.2mm; stem width, 13.4mm; internotch width, 9.2mm; stem thickness, 3.6mm; and tang height, 5.1mm. Both lateral margins have been retouched to a slightly serrated edge.

The sixth specimen (Cat.#L426), missing its tip and a portion of one of its tangs, was recovered from Unit 713-252 in Midden 1. It has the following dimensions: total point length, 35.9mm; blade length, 24.6mm; blade width, 9.7mm; blade thickness, 4.5mm; stem length, 24.7mm; stem width, 10.0mm; internotch width, 7.6mm; stem thickness, 3.9mm; and tang height, 4.1mm. Both lateral margins have been retouched.

The seventh specimen (Cat.#L452), missing its tip, was recovered from Unit 713-259 in Midden 1. The point has the following dimensions: total point length, 43.7mm; blade length, 35.0mm; blade width, 11.4mm; blade

thickness, 4.0mm; stem length, 8.2mm; stem width, 15.4mm; internotch width, 10.0mm; stem thickness, 4.6mm; and tang height, 3.7mm.

The eighth specimen (Cat.#L813), missing its tip, was recovered from Midden 1 Unit 719-253 and has the following dimensions: total point length, 30.1mm; blade length, 21.7mm; blade width, 7.8mm; blade thickness, 3.6mm; stem length, 7.6mm; stem width, 11.8mm; internotch width, 8.1mm; stem thickness, 2.2mm; and tang height, 4.5mm. The left margin has been heavily retouched to the point where it meets the medial ridge and the side-notch has become quite shallow.

The final specimen (Cat.#L1073), missing its tip, was recovered from Unit 719-252 in Midden 1. The point has the following dimensions: total point length, 17.1mm; blade length, 9.7mm; blade width, 10.7mm; blade thickness, 3.0mm; stem length, 5.6mm; stem width, 14.4mm; internotch width, 7.6mm; stem thickness, 3.3mm; and tang height, 5.0mm.

One Late Iroquoian projectile point (ca.1,500-1,600 A.D.), missing a corner, was recovered from Unit 723-255 in Midden 1 (Cat.#L1079). It has the following dimensions: total point length, 21.1mm; width, 13.6mm; and thickness, 4.0mm. Both lateral edges exhibit bifacial retouch - one to a convex edge and the other to a straight edge. Both are slightly serrated.

Also recovered were 10 incomplete projectile point fragments: three mid-sections (Cat.# 0.02072, Cat.#L644 and Cat.#L685), three tips with mid-sections (Cat.#L217, Cat.#L360, and Cat.#L1278), two bases (Cat.#L483 and Cat.#L1124), and one base with mid-section (Cat.#L698), and one tip fragment (Cat.#0.02134). One projectile point base fragment (Cat.#L1124) likely represents a Nanticoke Notched projectile point type while one base with medial portion fragment (Cat.#L698) likely represents a Nanticoke Triangular projectile point type. The latter specimen's base also exhibits an "ear" flaked on one side and evidence of thermal alteration.

In addition to temporally diagnostic tools, a variety of formal tools were recovered which could not be attributed to specific periods.

4.3 Drills

Five drills, two complete and three fragments, all manufactured from Onondaga chert were recovered.

The first complete drill was recovered during the Stage 3 CSC (Cat. #0.01429). It has the following dimensions: total tool length, 46.5 mm; drill width, 10.0 mm; and drill thickness, 7.9 mm.

The second complete drill (Plate 42, Cat.#L776) was recovered from Unit 718-264 in Midden 1 and is fashioned from a primary thinning flake. It has the following dimension: total tool length, 29.6mm; drill length, 10.4mm; drill width, 12.8mm; and drill thickness, 7.6mm. The drill's bit is rounded and smooth.

A third drill (Plate 42, Cat.#L250) missing its base, was recovered from Unit 710-252 in Midden 1. It has the following dimensions: drill length, 25.2mm; width, 8.6mm; and thickness, 4.4 mm. The drill has been thermally altered.

Plate 42: Select Drills: Cat.#L250, Cat.#L776, Cat.#L909 and Cat.#L1156

A drill tip fragment (Plate 42, Cat.#L909) was recovered from Midden 1 Unit 720-259. It has the following dimension: drill length, 10.7mm; width, 6.8mm; and thickness, 6.0mm. The bit is rounded and smooth.

The final drill (Plate 42, Cat.#L1156), missing a small portion of its base and tip, was recovered from Midden 1 Unit 724-258. The drill has the following dimension: total tool length, 24.0mm; drill length, 14.7mm; drill width, 11.7mm; and drill thickness, 7.4mm.

4.4 Scrapers

Eighteen miscellaneous scrapers (nine endscrapers and nine side-scrapers) were recovered, ranging in length from 17.6 to 60.1 mm (mean=33.7 mm), in width from 12.2 to 40 mm (mean=21.4 mm), and in thickness from 3.7 to 14.7 mm (mean=10.6) (Plate 43). Of these, one endscraper was fashioned on a primary reduction flake, four endscrapers and nine side-scrapers were fashioned on primary thinning flakes and four endscrapers were fashioned on secondary knapping flakes. Except for one endscraper (Cat.#L29), which was recovered from a support post in House 2, and four side-scrapers which were all recovered during the Stage 3 CSC (Cat.#0.12560, Cat.#0.13200, Cat.#0.10850 and Cat.#0.01382), remaining scrapers were recovered from units excavated in Midden 1. All scrapers were manufactured from Onondaga chert. Details and metrics on each artifact can be found in Appendix I.

Plate 43: Select Scrapers: Top row (left to right) Cat.#L29, Cat.#L273, and Cat.#L654. Bottom row (left to right) Cat.#L1089, Cat.#L1106 and Cat.#L1222

4.5 Spokeshave

Two complete spokeshaves are present in the assemblage. Both were recovered from Midden 1 and are manufactured from Onondaga chert. The first (Plate 44, Cat.#L385) was recovered from Unit 712-260 and is fashioned on a primary thinning flake. It has the following dimensions: length, 36.3 mm; width, 23.0mm; and thickness 4.2mm. This tool exhibits evidence of thermal alteration.

The second spokeshave (Plate 44, Cat.#L1123) was recovered from Unit 724-246 and is fashioned on a primary thinning flake. It has the following dimensions: length, 44.3mm; width, 21.0mm; and thickness 9.8mm.

Plate 44: Spokeshaves: Cat.#L385 and Cat.#L1123

4.6 Borers/Piercing Tools

A total of five complete borer/piercing tools, all manufactured from Onondaga chert are present in the assemblage.

The first specimen was recovered during the Stage 3 CSC (Cat.#0.01576). It is fashioned on a secondary knapping flake and has the following dimensions: total length, 21.9 mm; width, 6.8 mm; and thickness, 5.9 mm. The tool exhibits evidence of thermal alteration.

The second specimen (Plate 45, Cat.#L440) is fashioned on a secondary knapping flake and was recovered from Midden 1 Unit 713-256. It has the following dimensions: total length, 21.7mm; width, 11.8mm; thickness, 5.8mm. The borer tip is located at the proximal end of the flake.

The third tool (Plate 45, Cat.#L448), fashioned on a primary thinning flake, was recovered from Midden 1 Unit 714-249. It has the following dimensions: total length, 36.3mm; width, 20.5mm; thickness, 10.0mm.

The fourth tool (Plate 45, Cat.#L697), fashioned on a primary thinning flake, was recovered from Midden 1 Unit 717-260. It has the following dimensions: total length, 30.3mm; width, 24.5mm; thickness, 6.2mm.

The final tool (Plate 45, Cat.#L1167) is fashioned on a secondary knapping flake and was recovered from Midden 1 Unit 714-249. It has the following dimensions: total length, 36.3mm; width, 20.5mm; thickness, 10.0mm.

Plate 45: Borer/Piercing tools: Cat.#L440, Cat.#L488, Cat.#L697 and Cat.#L1167

4.7 Bifaces

Thirteen bifaces (seven complete and six partial) are present in the assemblage. One biface fragment was recovered during the Stage 3 CSC while the remaining 12 were recovered from Midden 1. All bifaces are manufactured from Onondaga chert. They range in size from 16.6 to 58.0 mm in length, 15.5 to 42.0 mm in width and 4.4 to 20.0 mm in thickness.

Five of the complete bifaces have been classified as refined (Cat.#L357, Cat.#L357, Cat.#L1010, Cat.#L1056 and Cat.#L1163) and two as early stage production (cat.#L1214, Cat.#L1 and Cat.#L1065). Of the five refined specimens, one can be further classified as a slender conical shape (Cat.#L1214) and another as a slender oval shape (Cat.#L1010). Cortex is present on one biface (Cat.#L1065) while another specimen (Cat.#L357) exhibits evidence of thermal alteration. Details and metrics on each artifact can be found in Appendix F.

4.8 Wedges

Seven wedges, all manufactured from Onondaga chert, are present in the assemblage. Four of the wedges were recovered during the Stage 3 CSC and three from Midden 2. No thermal alteration is evident on any of the specimens.

4.9 Debitage Analysis

A total of 7,238 pieces of chert debitage was analysed representing 98.96% of the total lithic sample. Of this material, 7.3% (n=526) was recovered during the Stage 3 CSC and Test Unit excavations while 92.7% (n=6712)

was recovered during Stage 4 excavation activities including 95.3% from Midden 1 (n=6398), 1.2% from Midden 2 (n=78), and 3.5% from features (n=236). Thermal alteration was evident on 1,272 pieces and retouch was noted on 28 pieces of debitage. Onondaga chert accounts for 7,224 pieces of debitage, the balance are of Lockport chert (n=6), quartz (n=2) and unidentifiable materials (n=6).

A number of trends are evident in the proportions of various types of primary and secondary flakes (n=2,427). Overall, primary reduction flakes (n=16; 0.7% of the collection) and primary thinning flakes (n=245; 10.1%) are weakly represented in the collection. Secondary knapping flakes are clearly the most common form (n=1874; 77.2% of the collection), followed by secondary retouch flakes (n=292; 12.07%). In general, this pattern suggests that the early stages of reduction and stone tool manufacture were undertaken elsewhere and the production and refinement of finished bifacial tools took place at the site, a pattern consistent with the distance to the Onondaga outcrops on the Niagara Peninsula and the north shore of Lake Erie.

4.9.1 Cores

Eight cores all manufactured from Onondaga chert are present in the McNair assemblage. Four of the cores were recovered during the Stage 3 CSC, two from Midden 2 and three from Midden 1. Thermal alteration is evident on one specimens (Cat.#0.01064).

4.10 Spatial Distribution

No discernable pattern of distribution of flaked lithic artifacts is apparent across the site in terms of concentrations of tools and debitage. The vast majority of the lithic artifacts was recovered from Midden 1 (n=6,669) followed by 237 from settlement features and 78 from Midden 2. The remaining 330 lithic artifacts was recovered during the Stage 3 controlled surface collection (n=206) and the Stage 3 test units (n=124).

The lithic artifacts recovered from Midden 1 include 6,613 pieces of debitage and 56 tools and tool fragments, which comprise 20 complete projectile points and point fragments, 13 complete scrapers, 11 complete bifaces and biface fragments, four borer/piercing tools, four complete drills and drill fragments, two spokeshaves, and two cores.

The features at the site produced 237 flaked lithic artifacts including two complete projectile points, one endscraper and 234 pieces of debitage.

The lithic artifacts recovered from Midden 2 include 78 pieces of debitage including one primary thinning flake, 27 secondary knapping flakes and 50 pieces of shatter.

A total of 206 lithic artifacts was recovered during the controlled surface collection including four side-scrapers, four cores, four wedges, two complete projectile point, one biface fragment, one borer/piercing tool, one drill/perforator tool, and 189 pieces of debitage.

A total of 124 lithic artifacts was recovered from one metre square units excavated in the plough zone. These include three cores, three wedges, two projectile point fragments, one complete biface and 115 pieces of debitage.

5.0 GROUND STONE ARTIFACT ANALYSIS

Martin S. Cooper

5.1 Introduction

A total of 29 ground stone artifacts was recovered from the Stage 3-4 excavation of the site. These include 21 incomplete and/or fragmentary pieces of celts, two manos, one hammer stone and one pendant (Table 46). Also included in the assemblage were four pieces of miscellaneous ground stone (Table 46). A complete catalogue of artifacts discussed in this section can be found in Appendix J.

Table 46: McNair Site (AlGu-8) Ground Stone Artifact Class Totals

Artifact	Frequency	Percent
Celts	21	72.4
Manos	2	7.0
Hammer stones	1	3.4
Pendant	1	3.4
Misc. Ground Stone Tools	4	13.8
TOTAL	29	100.0%

5.1.1 Celts

Celts are a “catchall” term for ground stone woodworking tools that include axes, adzes and chisels. A total of 21 incomplete celt and celt fragments was recovered from the site. These include three complete bit portions, two bit fragments, three bit plus midsection portions, six midsection portions, and two almost complete specimens. The remaining five items are chloride schist fragments with exterior surface polish. In terms of material, chloride schist was used in the manufacture of 17 celts, while one celt was manufactured from gneiss, two from amphibolite and one from an unidentifiable material.

Three tools were complete enough to assign a tool function based on their size and/or bit symmetry. These include two specimens that functioned as axes (Cat.#G4 and Cat.#G11) based on their symmetrical bit and one chisel-like wood working tool (Cat.#G8), based on its size. In terms of material, chloride schist was used in the manufacture all three tools. Chloride schist’s fine grain and relative hardness make it an ideal material for axes, adzes and chisels as it can be honed to a fine edge.

The first axe (Cat.#G4), recovered from a post mould in House 4 is an extremely battered tool that is missing its bit. It has a battered poll suggesting that it may have also been used as a wedge. The axe measures 137 mm in length, 83 mm in width and 34 mm in thickness.

The second axe (Cat.#G11), recovered from Unit 713-261 in Midden 1 is split along its longitudinal axis (Plate 46). The presence of use wear polish on the interior fractured surface suggests that it was reused after it had been broken and flaking along the bit's edge may indicate that it was reused as a wedge. The axe measures 91 mm in length, 37 mm in width and 24 mm in thickness.

Plate 46: Ground Stone Artifacts: Chisel (Cat.#G8) and an Axe (Cat.# G11)

A small complete chisel (G8), recovered from Unit 712-246 in Midden 1, has a honed and polished symmetrical bit that is rectangular in plan view and trianguloid in cross section (Plate 46). The chisel has the following dimensions: 64 mm in length, 20 mm in width and 8 mm in thickness.

5.1.2 *Manos*

Two tools have been classified as manos or grinding stones in the McNair site ground stone assemblage. These tools were used to grind plant material such as maize, sunflower, acorn, etc. The first mano (Cat.#G13) is manufactured from a basalt cobble and has a flattened grinding surface on one lateral margin (Plate 47). It was recovered from the Stage 3 Test Unit 615-340. This location is close to the large boulder found in House 4 that had been used as a metate (Feaute 183). The mano has the following dimensions: 94 mm in length, 70 mm in width and 42 mm in thickness.

Plate 47: Manos from the McNair site (Cat.#G13 and G23)

The second mano (Cat.#G23, Plate 47), also likely a mano, is a pink granite cobble and has a flattened, smooth grinding surface on its bottom end. It was recovered from an ash pit in Exterior Activity Area north of House 1 (Feature 58). This tool measures 110 mm in length, 91 mm in width and 42 mm in thickness.

5.1.3 Hammers

Hammers consist of pebbles or cobbles with at least one working facet, which usually exhibits pecking and/or grinding. These tools were likely brought to the site to be used in chert tool manufacturing. Hammer stones would have been used in the initial reduction stages of biface manufacturing.

Pitted hammer stones, sometimes referred to as pitted or bi-pitted anvil stones are cobbles that possess centrally placed depression on one or both surfaces. These depressions, which range from well developed depressions to surface roughening, were used to provide a secure grip. These tools often have one or more hammer facets represented by pitting on the lateral margins.

One hammer stone is present in assemblage. The tool is a small cobble hammer made from an unidentified stone with slight, centrally placed grip roughening on both surface of the tool (Cat.#G24). It was recovered from Unit 717-249 in Midden 1. The hammer has multiple, well defined hammer facets on its lateral margins and measures 60 mm in length, 57 mm in width and 43 mm in thickness.

Cobbles such as these would have been readily available in riverine, lacustrine and glacial deposits.

5.1.4 *Pendant*

A single black shale pendant (Cat.#G22) was recovered from Unit 712-252 in Midden 1 (Plate 48). Although the pendant is incomplete, as a break is present at the bidirectional perforation, it appears to be lanceolate in shape. There is notching or coarse serration on the lateral margins which changes to fine serration towards the tip. Fine incised lanes are present on one side of the pendant oblique to the lateral margin. Polish is present on both surfaces.

Plate 48: Pendant (Cat.# G22)

5.1.5 *Miscellaneous Ground Stone*

Four ground stone artifacts of unknown use are present in the assemblage. The first, recovered from Stage 3 Test unit 700-315 is a round, water worn sandstone pebble with a hole in its centre (Cat.#0.02004). This piece shows no evidence of polish or modification marks. The second is a small oddly shaped piece of sandstone (Cat.#G18) with parallel striations on both sides. The third piece is a small concave bowl shaped sandstone pebble (Cat.#G7). All three of these items are likely natural but may have been curated as curios. The final piece is a gneiss spall flake (Cat.#G22) with polish on its exterior surface.

6.0 COPPER ARTIFACT ANALYSIS

Andrea Carnevale and Martin Cooper

6.1 Copper Scrap

A single copper artifact (M1) was recovered from the McNair site (Plate 49). The piece of scrap was manufactured from native copper that was either mined from the massive deposits found in the Lake Superior basin or from pure nuggets or float copper found in glacial deposits and stream beds. The copper was heated to anneal or soften it and then cold hammered to the desired shape. There is no evidence that copper was smelted or poured into moulds in precontact North America.

Table 47: McNair site (AlGu-8) Copper Artifact Catalogue

Cat. #	Provenience	Artifact Type	Length (mm)	Width (mm)	Comments
M1	694-315	Misc. scrap	54	13	bent

The McNair native copper artifact is relatively thick and is bent into a “v” shape. Its use is unknown.

Plate 49: Copper Artifact from the McNair site (AlGu-8)

7.0 FLORAL ANALYSIS

Stephen G. Monckton

7.1 Introduction

A total of 18 soil samples was analysed, representing a volume of 75 litres. These include material from external longhouse middens, ash pits, general pits, hearths and one semi-subterranean structure or sweat lodge. All samples were analysed to provide an opportunity to evaluate both plant use and the spatial distribution of plant material across the site. Light and heavy fractions are stored for future analysis at Archaeological Services Inc. The following is a review of analytical methods and offers interpretations of the findings.

7.2 Analytical Methods

Light and heavy fractions were passed through screens which aided in the sorting of material. Light fractions were generally small enough to warrant the use of only 2 mm and 0.3 mm screens. Material above 2 mm was divided into wood charcoal and other plant parts while material smaller than this was sorted for seeds only (Monckton 1992).

Whenever possible, a sample of 25-30 wood charcoal fragments was selected at random from each feature. Each fragment was broken in half in order to examine the wood structure. All identifications were made using a ST-300 stereo dissection microscope at 7-40x magnifications.

7.3 Results

7.3.1 *Cultigens and Noncultigens*

Despite the relatively small number of samples, the McNair site revealed four of the five known Iroquoian cultigens: Maize (*Zea mays*), bean (*Phaseolus vulgaris*), sunflower (*Helianthus annuus*), and tobacco (*Nicotiana rustica*). Maize is the most abundant (5.78% of the assemblage), followed by sunflower (4.02%), tobacco (1.01%) and bean (0.25%) (Tables 48-49). Beans are comparatively rare at most archaeological assemblages, and McNair is no exception with only one specimen recovered from the site. The relative contributions of these cultigens to the site deposits are broadly similar to that of other Iroquoian sites. Sunflower, because of its distinctive shell micro-morphology, can be readily identified even when recovered as tiny fragments. It is thus probably over-represented in the archaeological record relative to bean.

Collected plants include: the common fruits of bramble (*Rubus sp.*), strawberry (*Fragaria sp.*), elderberry (*Sambucus sp.*), black nightshade (*Solanum americanum*), pin cherry (*P. pensylvannica*), seeds of sumac (*Rhus typhina*), spikenard (*Aralia sp.*), bedstraw (*Galium sp.*), small grasses (*cf. Echinochloa*), and cat-tail (*Typha latifolia*). Acorn (*Quercus sp.*) was the only documented nut taxon (Tables 48-49).

*Estimated number is based on the weight of 100 whole charred kernels (10.86 grams)

7.3.2 Wood Charcoal

Tree taxa represented by wood charcoal include maple (*Acer saccharum*), beech (*Fagus grandifolia*), ash (*Fraxinus sp.*), elm (*Ulmus americana*), red and white oak (*Quercus rubra* and *Q. alba*), ironwood (*Ostrya virginiana*), and white pine (*Pinus strobus*). The assemblage is clearly dominated by beech and maple, followed by ash, ironwood, red oak, elm, white oak and white pine (Table 50, Figure 16). A significant quantity of the unidentifiable fragments was designated as deciduous tree wood.

Figure 18: McNair Wood Charcoal Remains (Count vs. Type)

7.4 Discussion

The economic importance of maize is well attested by early visitors to the lower Great Lakes region whose references to the plant and contexts of its use abound in their writings (e.g., Thwaites 1896-1901). Researchers have since considered maize, beans and squash to be the mainstay of peoples' existence. The importance of maize has been supported in part by some of the early historical records, but also a growing body of paleoethnobotanical evidence (Crawford and Smith, 2003) and chemical and morphological analyses of human bone (Williamson and Pfeiffer, 2003). While there is recent evidence of maize in the Northeast as early as 2000 BP (Thompson et al. 2004), most researchers agree that maize was not an established food staple until early in the Iroquoian tradition a thousand years later.

Maize occurs in the form of cob fragments, stems, and maize kernels. These are usually quite fragmentary depending on the context. Kernels are the most delicate of maize remains and usually present themselves as small fragments with an identifiable thin epidermal/seed coat surface and obverse mass of endosperm tissue. These kinds of kernel fragments are clearly not grouts resulting from seed grinding, but fragmented kernels that were initially dry enough to be charred without exploding. It is quite uncommon to find large quantities of intact, measurable kernels. The latter situation may arise where substantial quantities of maize kernels have been spoiled (i.e., burned) and left in a deposit that remained undisturbed. The key factor here is that large quantities were deposited over a short period of time, increasing the probabilities of some kernels remaining intact. Contexts in which such a scenario appears to have occurred are the fill of support post features, basal midden deposits, and deep refuse filled pits. The McNair site provides 179 charred specimens.

The majority of assemblages appear to have sparsely distributed cultigens in most features excavated. These are usually comminuted, and their numbers must be estimated by their weight. Bean and cucurbit by contrast are much less common in most deposits. Bean, for example is mentioned frequently in the reports of the Jesuits in the 17th century (Thwaites 1896-1901; 2: 21; 2: 165, 207, 298; 5: 282; 10: 103; 13: 41, 75, 189; 15: 153; 17: 17; 21: 195; 38: 245; 40: 255; 42: 197; 43: 183; 50: 145; 54: 207; 59: 129; 67: 213; 68: 137), but its preparation for food appears to all but eliminate it from the record at many archaeological sites. Unusual preservation, such as

the accidental burning of food in areas unrelated to cooking, appears to have occurred at the protohistoric Huron Auger site (Latta 1985). This may have been responsible for the charring of one of the largest measureable samples of bean in eastern North America (Monckton 1992: 37). Similarly, cucurbit is archaeologically elusive, but is frequently mentioned in ethnohistoric reports (Thwaites 1896-1901; 2: 21; 2: 165, 207, 298; 15: 153; 21: 195; 38: 245; 43: 183; 50: 145; 54: 207; 59:129; 67: 213; 68:137). No specimens were recovered from the site. Preparation for consumption often involved cooking them whole in ashes (Thwaites 1896-1901; 10:103; 15: 161-162), or cutting them into small pieces for adding to the *sagamité* (Wrong 1939: 107). Interestingly, most remains recovered are in the form of seeds rather than rind. Exceptions include the Auger (Monckton 1992: 36, Plate 6) and the Mantle site near Stouffville (Monckton and Forrest, 2012) where peduncles were recovered frequently. It is important to note, however, that these instances may have involved special conditions of preservation and deposition. The beans from these sites fall broadly within the range of measurements found in other reported populations, some of which are both charred and uncharred (Blake and Cutler 1982; Monckton 1992: 38).

Remains of sunflower, on the other hand, are fairly common in Iroquoian deposits, while mentioned rarely by early historic observers in the *Relations* (Thwaites 1896-1901; 37: 105; 65: 129), or by Champlain (Biggar 1922-1936; 3: 50). Most remains consist of small fragments of achenes (sunflower shell). It is likely that this cultigen is better represented in the archaeological record because of its distinctive micro-morphology and durability. The McNair site provides 16 specimens.

Unlike the other cultigens, tobacco is represented by extremely small and very delicate seeds. When considering the prodigious quantities of seeds this plant produces (up to a million per plant) and the frequency of ceremonial activity surrounding it (Thwaites 1896-1901; 3: 117; 5: 113; 7: 137, 139; 17: 81-83, 127; 18: 187; 20: 187; 32: 229; 38: 253), it is surprising that more are not found in the archaeological deposits. As just stated, however, they are very delicate and, when discovered, hollow. Of course, given that much ceremonialism involving tobacco sometime required 'cakes' of it to be thrown onto the fire (Thwaites 1896-1901; 10: 159; 13: 209; 23: 55), the direct flame would have incinerated most of them. Charring without complete destruction requires indirect heat by fire. Quantification and assessment of tobacco's importance in a community is therefore compromised by these factors. The McNair site provides four specimens.

7.4.1 Collected Plants

The most abundant category of plant remains apart from wood charcoal is the fleshy fruits. At McNair, raspberry, strawberry and elderberry are the most frequent both inside and outside the longhouses. This is similar to what has been noticed at most settlements in southern Ontario. An excellent example is the Middle Iroquoian Myers Road site which yielded high figures for fruit (40%), rivalling that of maize (39.6 %) (Monckton 1998). Also, it has long been apparent that fleshy fruits are the greatest contributors to midden deposits on the perimeter of settlements (Monckton 1992; Dieterman 1999). The House 6 samples from the McNair site are interesting because they exhibit fleshy fruit frequencies even higher than Myers Road outside areas (Figures 17 and 18).

Figure 19: McNair site Cultigens and Noncultigens Remains for House 6 vs. External Area (Count vs. Type)

Figure 20: McNair site Wood Charcoal Remains for House 6 vs. External Area (Count vs. Type)

That fleshy fruits can and probably were dried and stored for winter use does not rule out the probability of large quantities being consumed when in season. Strawberry is available only in early summer (June) and is well represented in both the longhouse and external features. This could represent early summer activities, such as first fruit festivals (Waugh 1916: 125-128).

Other plant taxa found at the McNair site are also widespread in Iroquoian settlements, though in smaller numbers. The most common ones are sumac, cat-tail, and spikenard. Sumac commonly grows in disturbed areas. Ojibwa, Menomini, and Potawatomi are known to have used this in beverages, medicines, and for smoking (Smith 1933: 38). The majority of sumac seeds at McNair were recovered from external features. Spikenard apparently had a number of uses, mainly medicinal (for a review see Monckton 1992: 52). Given that there were only two recovered, one inside and another outside the houses, not much more can be said. Cattail is not mentioned in historical accounts but may represent what the Jesuits referred to as rushes used to cover the longhouse floors and roofs (Thwaites 1896-1901; 42: 205; 58: 209; 59: 129, 133, 155). Cat-tails are found

mainly in longhouse contexts, being represented by 16 specimens recovered from House 6 features and several external activity area features.

Greens/grains are difficult to interpret as economically important at McNair, though there is precedent for larger quantities of peppergrass and erect knotweed elsewhere (Monckton 1992: 48). These are well represented in the external features.

7.4.2 Wood Charcoal Distribution

Upon initial examination of the wood charcoal data, there appears to be a dominance of beech, maple and ash in the deposits with variable quantities of oak and ironwood (Figure 18). However, external longhouse features exhibit higher frequencies of beech and ash wood charcoal (Figure 18).

7.5 Site Comparisons

The Iroquoian Hope (AlGu-199), Murphy-Goulding/Orion, and McGaw settlements are located within a 10 kilometer radius of the McNair site, and probably date to within a few decades of this settlement (Pihl 2003). Plant remains from these sites provide for comparisons of plant remains deposition and add depth to interpretations of the McNair environment.

In order to compare plant remains from these sites, only flotation samples are used. Manually collected finds, while valuable for measurements of seed dimensions, are inherently biased in favour of larger objects visible to the naked eye. Flotation samples, on the other hand, provide the entire range of seed size and frequency per litre of soil. Figures 19 and 20 illustrates the relative frequencies of major seed categories at McNair: cultigens, fleshy fruits, greens and grains, other plant taxa, unknown plant taxa, and unidentifiable specimens and compares them with frequencies from the other sites. In all four sites the relative proportions of fleshy fruits are close to, or exceed, the representation of cultigens in the assemblages. McNair exhibits the highest seed density of the sites discussed here (Figure 20).

Figure 21: Seed Category Distribution by Site

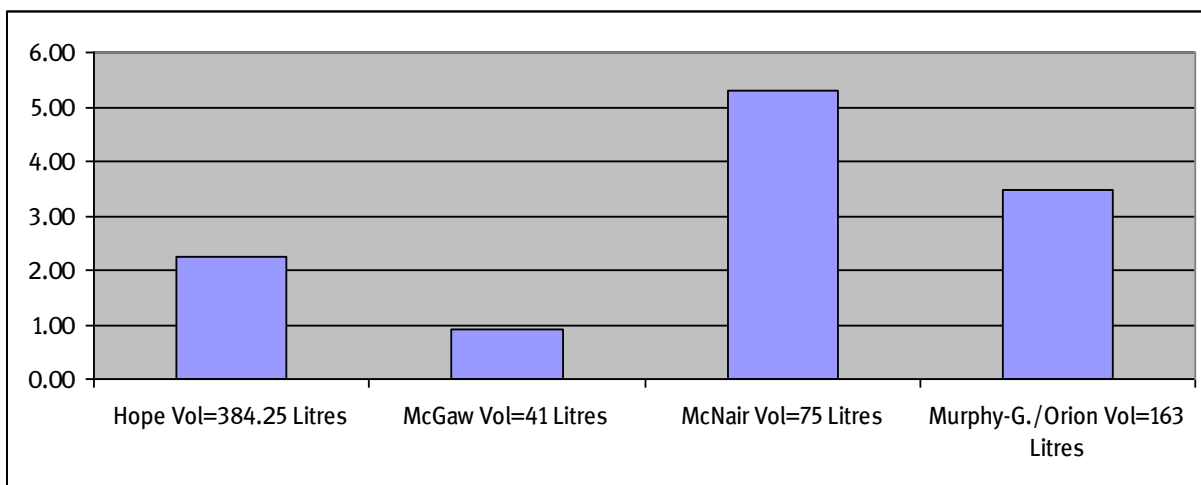

Figure 22: Frequency of Seeds per Litre of Soil by Site

Figure 23: Wood Charcoal Comparisons by Site

Wood charcoal from these sites shows the general trend in favour of maple and beech dominated forests. It should be noted that despite the variability of frequencies for each taxon from site to site, there is consistency in the order of dominance within each settlement (Figure 21). This is overwhelming evidence of non-selective fire wood gathering, which has resulted in a random sampling of dried wood from the forest floor.

8.0 ZOOARCHAEOLOGICAL ANALYSIS

Suzanne Needs-Howarth

8.1 Introduction to Worked Bone Analysis

The analyzed faunal assemblage from the McNair site consists of 3,677 specimens. All specimens in this assemblage were examined and identified to class including 255 pieces of worked bone. Most of the material was recovered from the one-metre excavation units in Midden 1 (n=3,207) followed by features (n=336), post moulds (n=45), Stage 3 Test Units (n=30), Stage 3 CSC (n=30) and Midden 2 (n=29).

Approximately 3% (n=14) of the bone in feature and post context was worked while approximately 7% (n=241) of the worked bone was recovered from Middens 1 and 2. The overall percentage of worked bone in the assemblage is 7% (n=255). A complete inventory of all faunal specimens is listed in Appendices K and L.

8.2 Method

A total of 255 bones examined exhibit evidence of being altered by humans. All faunal material recovered was identified to class where possible.

Dimensions are recorded only where these are not inherent in the portion present (i.e. if the piece is not an entire element or entire circumference). For broken beads only the length was recorded. If the item is not rectangular or square in shape, only maximum dimensions are recorded. Dimensions are recorded to the nearest millimetre (with the length measurement taken roughly parallel to the direction of bone growth and the width at 90 degrees to that).

Any thermal alteration on faunal material recovered from features and post moulds have been noted as this may affect the interpretation of feature type. Conversely, in middens, faunal material represents such a mixture of different activities that the presence or absence of thermally altered bone does not aid in the interpretation of these areas.

All worked bone encountered while examining and cataloguing the faunal material was separated from the main bags, sorted individually by catalogue number, analyzed and photographed. Any worked bone that appeared unusual was noted as such. The worked bone assemblage is described in more detail below.

8.3 Discussion

The taxa represented by the worked bone in the assemblage are summarized in Table 51. Many of the worked bone specimens were broken beads or awls, formed from highly modified longbone fragments, many of which could not be identified to species (Plates 50-52). Those species that were positively identified are *Eastern elliptio*, bowfin (although this may be a natural item), Canada goose, Trumpeter swan, human remains, beaver, dog, wolf, fox and deer.

Most of the material not identified to species consists of bird and mammal fragments, but there are also a number of worked gastropod shells, one-metre excavation units in Midden 1. These shell beads may all originally have been strung together, but they were not discarded together.

Table 51: McNair site worked bone taxonomic summary

taxon	common name	NISP
Pelecypoda	class bivalve	7
<i>Elliptio dilatatus</i>	Eastern elliptio	1
Gastropoda	class gastropod	14
<i>Amia calva</i>	bowfin	1
Chelonia	turtle family	5
Aves - pigeon size		1

Mammalia - woodchuck to dog size		4
Mammalia - dog size		39
Mammalia - dog to bear size		38
Mammalia - bear, deer size		17
<i>Homo sapiens</i>	human	4
<i>Castor canadensis</i>	beaver	8
<i>C. familiaris</i> , <i>C. lupus</i> or <i>U. americanus</i>	dog, wolf or black bear	1
<i>Canis familiaris</i>	dog	9
<i>Canis lupus</i>	grey wolf	1
cf. <i>Urocyon cinereoargenteus</i>	grey fox	1
Artiodactyla	order ungulates	1
<i>Odocoileus virginianus</i>	white-tailed deer	5
Total mammal		127
Total		255

The types of worked bone identified in the assemblage are summarized in Table 52. By far the most common recognizable items are beads; most of these are made from aquatic gastropod shells, or the bones of large birds or dog. A total of 129 beads and bead fragments was recovered from various areas across the site including Midden 1 (n=123), house wall posts (n=3), Midden 2 (n=2) and Feature 197 (n=1).

Table 52: Worked Bone Type Summary

likely function	NISP	Taxa
Tools		
awl	13	swan, dog, deer
expedient awl	6	swandog
blunt awl	8	medium or large mammal and bird
cut shell	5	
beaver incisor	8	
netting needle	9	medium to large mammal
Ornaments or ritual Objects		
bead	129	gastropods (14), goose, swan, dog
tube	1	large bird
bead waste	1	swan
polished canine	4	2 dog, 1 wolf or bear
gorget	5	1 bivalve, 4 human (could all be same piece)
perforated phalanx	1	deer
Uncertain Function		
unidentified/other	65	
Total 255		

Many of the beads have been ground and polished so that the original bone surface is no longer present. Some of the dog bone beads, however, have not received such treatment. It is tempting to speculate that these beads (for example, the dog humerus beads from Midden 1 (Cat.#F582 and Cat.#F1049; Plate 51) were left in recognizable form on purpose; people who had experience butchering or eating dog meat would probably recognize the beads as having originated from dog.

A swan ulna, recovered from a post in House 8 (725-270:Cat.# F117) appears to have been abandoned partway through the bead-making process. The ends are formed, and there is a deep groove in the middle, as if the person working on the bone was preparing to snap the piece in two to create two beads. There are no obvious signs that the bone was unsuited to this purpose, so the question remains as to why the bone worker abandoned what would be two perfect beads.

The collection also contains seven beaver incisors with modified biting surfaces that may have been used as tools and three polished dog canines. An additional polished canine of wolf or bear recovered from Midden 1 (Cat.# F277) may have been used as a tool.

One piece of shell, recovered from Midden 1, was perforated and may have functioned as a gorget (Cat.# F909; Plate 52).

Plate 52: Select Shell Beads (Cat.#F622 and Cat.#F682) and Shell Gorget (Cat.#F909).

8.4 Modified Human remains

Andrea Carnevale and Martin Cooper

The collection contains four modified human cranial fragments that likely represent fragments from a human skull rattle. All pieces were recovered from units in Midden 1 (716-264:Cat.#F773, 722-261:F1175 and 725-254:Cat.#F1302). The interior margins of each piece have been ground to a bevelled edge and polish is present along the exterior surface edge. Two of the fragments mend and a single incomplete perforation on the exterior surface is present. The perforations on these rattles are often bidirectional meaning that the hole was drilled approximately half way from one side then turned over and drilled from the opposite side. The bidirectional drill technique prevented the bone from splitting. There is no evidence of scoring or the beginning of a hole on the interior this piece. The presence of polish on the exterior surface may be due to wear from the bindings, from the haft or from handling.

Human skull rattles are found on Iroquoian sites throughout southern Ontario and New York State. With the exception of the Moatfield site rattle (the earliest documented human skull rattle, late 13th century), these objects are found on Late Iroquoian Period sites (circa A.D. 1400-1650) and occur well into the contact period having been identified at the seventeenth century Neutral Iroquoian Hamilton, Dwyer and Walker sites (Jenkins 2011). However, in recent analyses of these artifacts (Williamson 2007; Jenkins 2011), the vast majority are found on sites dating to a period of heightened inter-personal violence in the late 15th century.

Skull rattles consist of two concave discs typically derived from opposing parietal bones, usually originating from the same crania, however, in the case of the rattle recovered from the Moatfield site, the rattle appears to have been derived from two individuals (Williamson and Pfeiffer 2003). Rattles are manufactured by first removing the triangular section adjacent to the squamosal suture, thus forming a roughly circular shape. The margins, which usually maintain the suture lines, are lightly to heavily ground and biconical holes are drilled along the margins in order to bind the two halves of the rattle together. The holes are drilled from both the endocranial and ectocranial surfaces when the bone is still “fresh,” as there is still a significant lipid and collagen content, so that the bone does not crack or splinter (Williamson and Pfeiffer 2003). The holes could have been drilled any time from immediately after death to about a year later, depending on how the remains were handled. Skull rattles may have been held in the hand or fastened to a handle, analogous to a turtle shell rattle (e.g., Kenyon 1982:49, 52-53, 143, 209-211; Sempowski and Saunders 2001:103-105, 380-381, 600-602; Wray et al. 1991:63-64).

The use of skull rattles appears to be a widespread phenomenon, and peaks with the occurrence of scattered human bone and heavily fortified villages during the Late Iroquoian period and likely represents evidence of the emerging system of intertribal or inter-village warfare. Seventeenth century European observers described in detail the warfare involving the ritual of prisoner sacrifice and torture. Although not specifically mentioned by the early writers, skull rattles may have played an important role in certain ceremonies related to endemic warfare or used during war feasts held in advance of the departure of war parties. They may have also been used during dancing, feasting and curing ceremonies (Wrong 1939:115-116; Thwaites 1896-1901, 15:179, 17:213) or at other times when the aid of a spirit was invoked (Thwaites 1896-1901, 20:23).

8.5 Taxa represented

8.5.1 Pelecypoda – clams

The clams appear to be mostly freshwater bivalve of a size that may have been used for food. Only one could be identified to species as most of the pieces are very small, so that the amount of interdependence may be high. This also suggests the shell was put to a secondary use after the meat inside was consumed – one that would require the shell to be smashed into little bits. Bivalves that were mostly intact were worked.

8.5.2 Gastropoda – snails

The snails appear to be mostly land snails, which may be intrusive to the archaeological contexts. Some are aquatic snails, all but two of which are drilled. All but one of these drilled gastropods appears to be the same taxon, either *Pleurocera acuta* or *Gomibasis livescens*. The former is found in quiet areas of large streams and lakes (Clarke 1981:82), whereas the latter is found in lakes, rivers, streams of all sizes and springs (Clarke 1981: 84). The snail could belong to any number of taxa occurring in the Great Lakes. The gastropods may have been eaten, although the marine taxa were obtained primarily for bead production, and at least some of the terrestrial taxa may be intrusive to the archaeological deposits.

8.5.3 Osteichthyes – fish

Most contexts with fish bones have one or more salmon family (Salmonidae) vertebrae (salmon or trout as well as whitefish or cisco) and often also Catostomidae (sucker) vertebrae. Eel was recovered in several Midden 1 squares and the pharyngeal plates of an enormous freshwater drum was recovered from two squares in Midden 1 (Cat.#F993 and Cat.#, F1117).

The majority of midden squares have no fish cranial bones. This is in contrast to many other Iroquoian sites, where cranial bones are ubiquitous. Furthermore, the vertebrae are of a variety of taxa in one context, suggesting food waste rather than processing waste of a large catch.

Fish scales were recovered from only Feature 209. Since preservation of other hard tissues appears to be as good as at other Iroquoian sites in the Toronto area, and since the large amount of bivalve fragments would have aided in preserving fish scales, the lack of scales may reflect a difference in fish processing.

Table 53 provides percentages of the total and a percentage of the main food taxa. Fish represent 30% of the total for the site, and 53% recovered from features and posts.

Table 53: Overview of assemblage by class at the McNair site (AlGu-8)

	Features & Posts			Middens			Unworked Bone		Worked Bone		Total		
	NISP	% food	%	NISP	% food	%	NISP	%	NISP	%	NISP	% food	%
Pelecypoda	22		6%	574		18%	588	17%	8	3%	596		16%
Gastropoda	3		1%	80		2%	69	2%	14	5%	83		2%
Osteichthyes	177	53%	46%	671	27%	21%	847	25%	1	0%	848	30%	23%
Amphibia	12		3%	4		0%	16	0%	0	0%	16		0%
Reptilia	8		2%	135		4%	138	4%	5	2%	143		4%
Aves	26	8%	7%	242	10%	7%	171	5%	97	38%	268	10%	7%
Aves or Mammalia	2		1%	2		0%	2	0%	2	1%	4		0%
Mammalia	131	39%	34%	1551	63%	48%	1554	46%	128	50%	1682	60%	46%
Fish, Bird, Mammal	334			2464							2798		
Total	381		100%	3259		100%	3385	100%	255	100%	3640		100%

8.5.4 Amphibia – amphibians

Recovered bone of this type represents frog and/or toad rather than salamanders.

8.5.5 Reptilia – reptiles

All recovered bone of this type represents turtle fragments. Several units in Midden 1 contain a turtle that is not a snapping turtle or painted turtle, the taxa most commonly identified on Iroquoian sites. It may represent *Clemys insculpta*, or wood turtle, however, the keratinous plate lines are not a perfect match.

8.5.6 Aves – birds

Most of the bird bone has been worked into beads. The only taxa identified were (trumpeter) swan, Canada goose, and sandhill crane. Trumpeter or tundra swans could only have been obtained in fall or spring, during their migration from or to Canada's north. Most of the worked and unworked bird bone that could be grouped into size categories is also of larger birds, with only a few bones that looked to be the right size for passenger pigeon. This dearth of pigeon is unusual for an Iroquoian site. Bird bones make up 30% of the total assemblage, but only 8% recovered from features and posts. This may relate to the lower number of worked bones in the non-midden contexts (overall, 38% of the worked bones are bird).

8.5.7 Mammalia - mammals

The mammal bones appear to be mostly of dog-sized mammal which, given the size range, likely represents dog, with some coyote and/or wolf. Some large mammal bones likely representing bear and deer were also present in the assemblage. Newly erupted as well as heavily worn, large bear molars are present, suggesting several individuals were represented. The assemblage does not have many deer teeth. This is supported by the paucity of deer in the worked bone assemblage – four of 255 pieces. There is one wolf maxilla among the worked bone assemblage.

There are eight worked beaver incisors. These may have been curated for some time; however, loose beaver cheek teeth were recovered from midden squares. It is likely that some of the incisors came from animals that were consumed within the use life of the midden.

A higher number of mammal bones were recovered from midden context than from features and/or posts (63% and 39% of the main food taxa, respectively).

9.0 SUMMARY AND CONCLUSIONS

Christopher Watts and Bruce Welsh

Since it was first documented in the 1920s, the McNair site (AlGu-8) has occupied a prominent place in the reconstruction of local Iroquoian settlement dynamics. The salvage excavations and material analyses described in this report shed new light on this important site, allowing us to better characterize its occupational history and use within a broader understanding of regional Iroquoian lifeways.

Based on this work, the McNair site appears to be a 1.0 hectare village occupied during the middle of the fifteenth century AD. It is situated atop a broad knoll around which flows a series of lower order watercourses including McNair creek to the east and a small tributary of the Don River (East Branch) to the west and north. With regard to settlement patterns, the site appears to have been organized into two discrete loci separated by a large open area. One of these loci, consisting of Houses 1, 2 and 4, is found along the relatively spacious and gently rounded southern end of the knoll. The other locus, comprising Houses 3, 5, 6 and 7/8, along with Middens 1 and 2, is situated at the knoll's more constricted northern end. Both loci are further defined by myriad open air activity areas and fence row formations. No evidence of a palisade was detected.

Several interesting observations may be made with respect to these settlement patterns. As stated in Section 2.0, with the exception of House 1, each of the documented structures is generally oriented in a northwest - southeast direction (Table 2 and Figure 8). Siting and constructing longhouses in this manner would have reduced the ingress of cold and potentially destructive winter winds. Interestingly, that Houses 5 and 7/8 had orientations of 112° and 110° east of north, respectively, may also signal a concern with the winter solstice. As noted by Mohawk traditionalist William Woodworth and discussed by Ron Williamson (e.g., 2009:152-153), the long axes of Iroquoian house structures at Myers Road, Holly and Alexandra were oriented 111° east of north, which would have permitted occupants to view the sunrise through the eastern ends of houses on the shortest day of the year. In the case of House 5 at McNair, such views may have been obstructed by appended fence rows (Figures 8 and 14) although these barriers may not have been coterminous with the construction and use of the dwelling.

Neither of these interpretations, however, speaks to the anomalous orientation of House 1. The slight northeast - southwest tilt of this structure may result from using the lay of the land at the southern end of the site in an efficient manner, although this seems unlikely given the abundance of space between Houses 2 and 4, not to mention the open area separating the two loci. Perhaps the orientation of this house relates to its seasonal or short-term use, particularly during warm weather months when winter winds were not an issue. Although both floral and faunal analyses are equivocal in this regard, the absence of continuous wall segments, bunk line posts and substantial refuse and ash pits would all seem to argue for a short-lived or infrequent use of House 1. Indeed, as Houses 2 and 4 can be also be characterized by a shortage of internal features, and entire wall sections are missing from House 4, including its southern end, it appears that this loci had an occupational character quite distinct from that of its northern counterpart. This is thrown into sharp relief when we compare the settlement features associated with Houses 6 and 7/8 including their more robust construction practices, the number and density of interior posts within their central corridors, and the proximity of these houses to Midden 1, all of which point to longer-term occupation. While some of these patterns can be explained by the presence of poor soil conditions in the southern reaches of the knoll, as noted in Section 2.0, this alone seems insufficient in accounting for the kinds of settlement patterns displayed at the McNair site.

Another reason for these perceived differences, beyond the possible seasonal use of the south locus or the vagaries of its preservation, may be that the occupation of the McNair site proceeded in phases as has been demonstrated at numerous other Iroquoian sites in southern Ontario such as Calvert, Myers Road, Grandview, Mantle and Draper. Based on the ceramic analysis provided in Section 3.0, which suggests a site wide dominance of types common in the fifteen century (i.e., Huron/Lawson Incised and Pound/Black Necked), any

time-transgressive occupation at McNair would have occurred during a relatively short interval. Still, in such a scenario, it is not hard to imagine an initial occupation of one locus followed by a short interregnum and, eventually, a reoccupation geared toward the second locus. This may also explain the lack of ceramic vessel mends between the two loci, as noted in Section 3.0. Though speculative, perhaps the initial occupation of the site was confined to the south locus where limited longhouse design and construction practices, along with the absence of midden deposits, were influenced by the length of time people expected to spend at the site. Susan Kent (1991) has discussed this idea in connection with hunter-gatherer camps, and has presented a model of intrasite spatial organization focused on what she calls ‘anticipated mobility.’ Based on ethnographic evidence, Kent (1991:42) noted that hut construction practices among Basarwa and Bakgalagadi groups in Botswana were influenced by anticipated stays of short (<3 months), medium (3-5.9 months) or long (≥ 6 months) duration. With only one exception, camps where occupants anticipated a stay of greater than six months contained huts constructed of more durable and labour intensive materials (e.g., mudbrick) as opposed to simple grass huts which required the least amount of time to construct. This principle is similar to Binford’s (1977) concept of ‘planning depth’ though as Kent notes, it is not linked to particular subsistence endeavours. This has important implications for McNair, as well as other Late Ontario Iroquoian sites, where we would not expect sweeping changes in dietary practices (e.g., the intensification of maize horticulture) to have played a role in site structure.

Whatever might have led to the apparent settlement pattern differences between the two loci, it is clear that the extent of occupation at McNair as a whole was of limited duration. Buttressing the ceramic evidence noted above, there are few signs of longhouse expansion, contraction, repair or superimposition. As well, there is a relative degree of uniformity across the site with regard to longhouse lengths and widths, which varied from 45 to 60 metres and 7.7 to 8.3 metres respectively (excluding Houses 3 and 5; Table 2). In fact, the longhouse lengths may be more standardized given the incomplete nature of House 8 and the possibility that the east end wall of House 7 was concealed by the treeline separating Lots 24 and 25. If this were true, then the overall length of House 7 would be 50 to 55 metres, similar to the lengths of Houses 1, 2 and 6. The discrepancy in the lengths of Houses 3 and 5 is likely a consequence of the former being abandoned before it was completed, perhaps as part of an initial and more transient occupation of the site as discussed above. That the latter departs so markedly from the other houses with regard to its overall size, form and internal feature arrangements may relate to its special purpose use as noted in Section 2.0.

Such ‘special purpose’ dwellings have been documented on other Iroquoian sites, notably in Simcoe County, including Copeland, Dunsmore, Holly and Wiacek, as well as the seventeenth century Ball and Molson sites (see Robertson et al. 1995:50-51). Of the atypical houses at these sites, House 5 at McNair compares favourably with Houses 6 and 7 at the mid-fourteenth century Wiacek site (see Robertson et al. 1995:Figure 7), particularly with regard to the presence of an enclosed area abutting House 6 and the number and density of posts oriented to hearth events in House 7. Robertson et al. (1995:50-51) have argued that House 6 at Wiacek may have served as a sheltered activity area or temporary warm weather structure; House 7, they note, likely functioned as a cold weather or year-round dwelling for a small group of people. This group may have represented a colonizing population, the fissioning of an extant (community-based) social entity, a task-oriented extended or nuclear family unit, or the arrival of new village residents. In light of the available evidence, which consists of two hearths and a number of post clusters, the most parsimonious interpretation of House 5 at McNair would be that of an above ground sweat lodge or locale for various domestic activities including those associated with food preparation.

A sizeable and noteworthy ceramic assemblage was recovered from McNair, including 539 analyzable vessels, 184 analyzable miniature or juvenile vessels and 433 smoking pipe fragments. One of the more remarkable artifacts in this class was a complete miniature vessel bearing incised lines and small linear punctates recovered from Feature 245, a sweat lodge in House 7/8. With regard to lithic items, no fewer than 76 formal tools were recovered from the site, including an array of scrapers, wedges, drills, bifaces and projectile points, the latter of which consisted of 26 complete or partial forms. Middle Archaic Brewerton and Late Archaic Crawford Knoll points were identified along with Nanticoke Triangular and Notched forms diagnostic of the Late Woodland (see Section 4.0). Large quantities of debitage, the overwhelming majority of which was made from Onondaga

chert (99.8%), are indicative of secondary and tertiary stage knapping activities common to Iroquoian village sites. Similarly, the presence of 29 ground stone items including numerous celts, two manos, one hammer stone and one black shale pendant also suggest activities associated with residential life. A number of bone objects (n=255) were also identified including tools (e.g., awls and netting needles) and ornaments (e.g., beads and fragments of human skull rattle). Many of these items were made on modified longbone fragments derived from birds such as Canada goose and Trumpeter swan, as well as mammals represented by beaver, dog, wolf, fox and deer. This class also contains four modified human cranial fragments that likely represent fragments of a human skull rattle (see Section 8.4).

While it was noted above that floral and faunal analyses were unable to speak to a seasonal vs. year-round use of McNair, the plant and animal remains recovered from the site are in entirety in keeping with those recovered from contemporaneous Late Woodland Iroquoian sites in southern Ontario. With regard to floral remains, three domesticated plant foods were noted including maize, bean and sunflower while the cultigen tobacco was also found. Non-domesticated fleshy fruits were also recovered including strawberry, elderberry and pin cherry, while acorn provided the only documented nut remains. Deer, an important source of meat, hide and bone for tools, was found along with numerous smaller mammals. The presence of [spring and fall spawning] fish also point to a significant economic investiture.

Since the completion of the McNair site excavations in 2004, the subdivision development that necessitated the work in the first place has been completed. Clearance of the archaeological concerns posed by the site with respect to the development was provided by the Ministry of Culture, Tourism and Sport (then the Ministry of Culture and Tourism) following the completion of the archaeological field work in the letters dated August 2004 and November 2004.

The McNair site (AlGu-8) may be considered clear of any further archaeological concern. This final report constitutes fulfilment of licensing commitments (P050-032 and P057-016) pursuant to the Ontario Heritage Act.

10.0 Advice on Compliance with Legislation

- This report is submitted to the Minister of Tourism and Culture as a condition of licensing in accordance with Part VI of the *Ontario Heritage Act*, RSO 1990, c 0.18. The report is reviewed to ensure that it complies with the standards and guidelines that are issued by the Minister, and that the archaeological field work and report recommendations ensure the conservation, preservation and protection of the cultural heritage of Ontario. When all matters relating to archaeological sites within the project area of a development proposal have been addressed to the satisfaction of the Ministry of Tourism and Culture, a letter will be issued by the ministry stating that there are no further concerns with regard to alterations to archaeological sites by the proposed development.
- It is an offence under Sections 48 and 69 of the *Ontario Heritage Act* for any party other than a licensed archaeologist to make any alteration to a known archaeological site or to remove any artifact or other physical evidence of past human use or activity from the site, until such time as a licensed archaeologist has completed archaeological field work on the site, submitted a report to the Minister stating that the site has no further cultural heritage value or interest, and the report has been filed in the Ontario Public Register of Archaeology Reports referred to in Section 65.1 of the *Ontario Heritage Act*.
- Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48 (1) of the *Ontario Heritage Act*. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out archaeological fieldwork, in compliance with sec. 48 (1) of the *Ontario Heritage Act*.
- The Cemeteries Act, R.S.O 1990 c. C.4 and the Funeral, Burial and Cremation Services Act, 2002, S.O. 2002. c.33 (when proclaimed in force) require that any person discovering human remains must immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Consumer Services.
- Archaeological sites recommended for further archaeological fieldwork or protection remain subject to Section 48 (1) of the *Ontario Heritage Act* and may not be altered, or have artifacts removed from them, except by a person holding an archaeological licence.

The documentation related to this archaeological assessment will be curated by Archaeological Services Inc. until such a time that arrangements for their ultimate transfer to Her Majesty the Queen in right of Ontario, or other public institution, can be made to the satisfaction of the project owner(s), the Ontario Ministry of Tourism, Culture and Sport and any other legitimate interest groups.

Cat. #	Qty.	CSC Station #	Square No.	Stage	House No./ Midden	Feature/Quad/Post Mould	Strata	Artifact Type	Flake Type	Material	Description/Comment
L17	1	605	380		5m2	F58 SW	fill	projectile point		onondaga	Naticoke Triangular point (ca. AD 1,300 - 1,600), fashioned on a flake. Point dimensions: total point ℓ = 25.8mm, w = 18.5mm, t = 3.4mm, base is straight and has been thinned. Evidence of hafting and prehensile ware on stem, haft element ℓ = 7.4mm, maximum haft element w = 9.9mm. Blade has been retouched to medial ridge on both faces, however the base portion of one face has no evidence of being knapped (ventral surface of flake, percussion ripples present) while dorsal scars are evident on the obverse side.
L18	2	605	385		5m2	F58 SW	fill	shatter		onondaga	retouched
L19	3	605	380		5m2	F58 NE	fill	shatter		onondaga	3 thermally altered
L20	2	605	380		5m2	F58 SE	fill	shatter		onondaga	
L21	1	605	385		5m2	F58	float - 3 L		secondary retouch flake	onondaga	
L22	1	590	320		5m2	F73	fill		primary thinning flake	onondaga

L27	1	590	320		5m2	F78	fill	projectile point		onondaga	Naticoke Notched point (ca. AD 1,400 - 1,600). Point dimensions: total point ℓ = 25.4mm, blade ℓ = 17.7mm, blade w = 8.8mm, blade t = 4.0mm, stem ℓ = 5.5mm, stem w = 8.1mm, internotch w = 7.9mm, stem t = 4.0mm, tang h = 4.6mm, base is straight. Evidence of hafting and prehensile ware on stem, haft element ℓ = 11.6mm, maximum haft element w = 5.6mm. One complete tang and a portion of the other is missing.
L28	2	590	320		5m2	F78	fill	shatter		onondaga	
L29	1	600	320		5m2	F87	fill	endscraper		onondaga	convex end scraper fashioned on a secondary knapping flake; dimensions ℓ = 28.4mm, w = 17.8mm, t = 5.2mm, straight edge retouch on right margin and convex retouch on left, convex working edge ℓ = 20mm and h = 2.3mm
L30	1	605	315		5m2	F92	fill		secondary knapping flakes	onondaga

L813	1		719 253		Midden 1		plough zone	projectile point		onondaga	Nanticoke Notched point (ca. AD 1,400 - 1,600), missing its tip. Point dimensions: total point ℓ = 30.1mm, blade ℓ = 21.7mm, blade w = 7.8mm, blade t = 3.6mm, stem ℓ = 7.6mm, stem w = 11.8mm, internotch w = 8.1mm, stem t = 2.2mm, tang h = 4.5mm, base is straight and has been thinned. Evidence of hafting and prehensile ware on stem, haft element ℓ = 8.0mm, maximum haft element w = 5.0mm. Point is not symmetrical, one side of the blade has been reworked to the point where the lateral edge now meets the medial ridge and the side-notch has become quite shallow.

0.12270	1	Stage 3 CSC Station #272	celt	chloride schist	no	bit/ midsection portion		polished and chipped				polish			83	49	21	Some polish on surface
0.12790	1	Stage 3 CSC Station #169	celt	chloride schist	no	midsection												
0.17780	1	Stage 3 CSC Station #111	celt	chloride schist	no	midsection						polish						
0.02004	1	700-315 Stage 3 Test unit	misc	sandstone	yes													round stone with a natural hole in its centre. No evidence of wear or modification on the piece. Natural possibly curated as curio
G1	1	720-280 F245 Q2	celt	chloride schist	no	midsection						polish						midsection portion of a large chloride schist celt
G2	1	685-295 Post 7	celt	chloride schist	no	midsection						polish						midsection portion of a large chloride schist celt, extremely battered, some surface polish
G3	1	714-248 Midden 1	celt	chloride schist	no	bit fragment		polish										small bit edge fragment
G4	1	House 4 Post Mold	axe	chloride schist	yes	majority	yes	battered	battered	yes		polish			137	83	34	extremely battered chloride schist axe with missing bit and battered poll may have been used as wedge
G5	1	722-253 Midden 1	celt	amphibolite	no	midsection						polish						celt frag
G6	1	722-253 Midden 1	celt	chloride schist	no	fragment						polish						celt frag
G7	1	700-285 Post 22	misc	sandstone	yes													small concave bowl shaped sandstone pebble. Natural but may have been intentionally curated as a curio
G8	1	712-246 Midden 1	chisel	chloride schist	yes	majority		polished and honed							64	20	8	small chloride schist chisel with honed and polished symmetrical bit. Rectanguloid in planview and trianguloid in cross section
G9	1	713-263 Midden 1	celt	chloride schist	no	midsection						polish						possible celt midsection with some polish. May be natural
G10	1	713-241 Midden 1	celt	chloride schist	no	fragment						polish						celt frag with surface polish
G11	1	713-261 Midden 1	axe	chloride schist	no	bit portion		polished and chipped				polish			91	37	24	chloride schist axe bit, originally split along longitudinal axis. Use wear on broken surface suggests that this was reused. Chipped bit edge is suggestive of a wedge
G12	1	723-258 Midden 1	celt	chloride schist	no	fragment						polish						celt frag
G13	1	615-340 Stage 3 Test Unit	mano	basaltic rock	yes							polish			94	70	42	mano made on a basalt cobble with flattened grinding surface on lateral margin
G14	1	726-254 Midden 1	celt	chloride schist	no	fragment						polish						celt frag with surface polish
G15	1	726-256 Midden 1	celt	chloride schist	no	fragment						polish						celt frag with surface polish
G16	1	727-265 Midden 1	celt	gneiss	no	bit fragment		polish				polish						celt bit frag made of gneiss. Probably bit corner frag
G17	1	707-250 Midden 1	misc	gneiss	no	spall flake						polish						gneiss spall flake with polish on exterior surface

Appendix J: McNair Site (AlGu-8) Stage 3-4 Ground Stone Artifact Catalogue

Cat. #	Qty	Provenience	Type	Material	Complete	Portion	Haft	Bit Wear	Poll Wear	Pecked	Depressions	Surface	Treatments	Facets	L (mm)	W (mm)	T (mm)	Comments
G18	1	715-258 Midden 1	misc	sandstone	no	fragment												small oddly shaped piece of sandstone with parallel striations on both sides. May be natural or curated as curio
G19	1	709-246 Midden 1	celt	chloride schist	no	bit/ midsection portion		polish				polish						two pieces of what appear to be the same chloride schist celt, although they do not mend. They appear to have split along three longitudinal plane. Remnants of the bit on one piece has a portion of polished and honed bit
G20	1	694-314 Midden 2	celt	amphibolite	no	bit/ midsection portion		polish				polish						dorsal/bit edge portion missing celt frag made of amphibolite. Some polish on surface
G21	1	615-340 F122 Q1	celt	unidentified	no	bit portion												bit fragment of a celt made of unidentified rock. Appears to have been altered, perhaps thermally altered
G22	1	712-252 Midden 1	pendant	shale	no	majority						polish			36	20	4	black shale pendant broken at the bidirectional perforation. The majority is present. Appears to be lanceolate in shape but is incomplete. Lateral notching or coarse serration, towards tip fine serration. On one side fine incised lines are present oblique to the lateral margin. Polish on both surfaces.
G23	1	605-380 Feature 58 QNW	mano?	granite	yes										110	91	42	possible mano made on pink granite cobble with flattened smooth grinding surface on the bottom.
G24	1	717-249 Midden 1	hammer stone	unidentified	yes										60	57	43	small cobble hammer with grip roughening on both surfaces and multiple hammer facets on lateral margin
