Stage 4 Salvage Excavation of The Proposed Visitors' Centre at Fort York National Historic Site (AjGu-26) Site Plan Application – 10 – 230516 STE 19 SA 250 Fort York Boulevard **City of Toronto, Ontario**

EXECUTIVE SUMMARY

Stage 4 archaeological salvage excavations were carried out within the construction impact zone of the proposed Visitors' Centre at Fort York National Historic Site (AjGu-26), located at 250 Fort York Boulevard in the City of Toronto. These excavations took place on tableland in the former Garrison Common that currently serves as a gravel parking lot for visitors to the fort. The previous Stage 2 assessment had documented significant heritage features related to the circa 1868-1936 Ordnance and Supply Yard for Fort York as well as the buried Garrison Common land surface. The building to be constructed, therefore, was designed to have as little impact as possible on these features, and the building footprint is largely confined to land previously disturbed by the construction of the Gardiner Expressway, as verified by the Stage 2 assessment.

The Stage 4 excavations were undertaken between July-December 2010 and May-July 2011 within that portion of the Visitors' Centre located east of the entrance drive between Garrison Road and Fort York Boulevard. The excavation proceeded systematically from east to west with the aid of a mechanical excavator that was used to remove late-twentieth-century parking lot fill to expose buried soil horizons in four contiguous trenches. The buried cultural layers and features were 100 percent hand-excavated into subsoil over an area of 370 square metres, of which 290 were stratigraphically block excavated. The field work produced 35,284 artifacts from 85 separate stratigraphic contexts.

The excavation revealed a rich cultural landscape that stretched from the pre-contact occupation of the tablelands to the twentieth-century utilization of Garrison Common. Fourteen artifacts directly linking this area to the Battle of York on April 27, 1813 were recovered while a thin scatter of early nineteenth-century artifacts points to the continuous utilization of this area by the soldiers from the Fort York garrison. Most of the archaeological material, however, related to the Ordnance and Supply Yard that was constructed in 1868 and expanded during the First World War. Most of the excavated area focused on the latter and revealed the remains of a 1910s-1936 carpenter shop and the 1920s-1936 forge that greatly expanded our understanding of the complex social and military history of Fort York and Garrison Common.

This report recommends, therefore, that the construction impact zone of the proposed Visitors' Centre east of the entrance drive to be constructed at Fort York National Historic Site (AjGu-26) be cleared of any further archaeological concern, with the proviso that the appropriate authorities must be notified should deeply buried archaeological or human remains be encountered during any future work on the property. The deeply buried archaeological remains located within that portion of the proposed Visitors' Centre located west of the entrance drive should be documented during construction by a way of a monitoring documentation agreement set up between a licensed archaeologist and the contractor.

ACKNOWLEDGEMENTS

Archaeological Services Inc. wishes to thank Mr. David Spittal, Cultural Assets Senior Project Coordinator for the City of Toronto, for advice and help preceding and during the excavation, as well as his help with artifact identification; Mr. David O'Hara, Fort York Administrator, for kindly providing access to resources and logistical support; Mr. Len Collins, Mr. Kevin Hebib, Fort York Programme Development Officer, and Mr. Richard Gerrard, War of 1812 Bicentennial Historian for the City of Toronto, who assisted us with artifact identification; Mr. Chris Laverton, Cultural Assets Technician, for his supplementary historical research; and Professor Joe Desloges of the University of Toronto who assisted with the geological identifications during the excavation. We would also like to thank Mr. Lloyd Johnston for his guidance and blacksmithing expertise and Mr. George Hoytema, Manager at Team Industrial Services, for the use of their Radiography and XRF facilities.

1.0 INTRODUCTION

Archaeological Services Inc. was retained by the Cultural Assets department of the Economic Development & Culture Division of the City of Toronto to carry out Stage 4 salvage excavation of the archaeological deposits at Fort York National Historic Site (AjGu-26) located within the construction impact zone that envelops the footprint of the proposed Visitors' Centre. The subject property (Figure 1), which is located at 250 Fort York Boulevard, encompasses an area of approximately 0.5 hectare.

Figure 1: The location of the proposed Visitors' Centre at Fort York National Historic Site (AjGu-26).

The general intent for the development of the study area, part of which is currently a parking lot, is the construction of a purpose-built facility that would serve to orient visitors to Fort York National Historic Site. The Stage 1 Archaeological Resource Assessment of this proposed undertaking was completed in 2008 (ASI 2008; MTCS PIF #P049-377-2008), and a Stage 2 assessment was carried out in 2009 and 2010 in association with Strata Consulting (ASI and Strata Consulting 2010; MTCS PIF #P102-004-2009 and #P102-005-2010).

The fieldwork began in 2010 under the project direction of Ms. Denise McGuire under archaeological license P315 (MTCS PIF #P315-026-2010) and the principal field direction of Dr. Andrew Stewart under archaeological license P102. The work was continued in 2011 under the project direction of Dr. Andrew Riddle under archaeological license P347 (MTCS PIF #P347-025-2011) and the principal field direction of Ms. Eva MacDonald under archaeological license P125 and Dr. Andrew Stewart under archaeological license P102. Other field directors were Wesley Oldham (R292) in 2010, Kiara Beaulieu (P375) in 2011,

and Aleksandra Pradzynski (R190) in both 2010 and 2011. Dr. Ron Williamson was the project manager. The *Ontario Heritage Act* trigged this assessment and all activities were completed in accordance with the terms of the Ministry of Tourism, Culture, and Sport's 1993 *Archaeological Assessment Technical Guidelines* (MTCS 1993).

The City of Toronto granted Archaeological Services Inc. permission to access the study area and to carry out the activities necessary for the completion of the mitigative excavation on June 7, 2010. The following report includes the study background, contextual history, field methods, analysis, discussion, and recommendations as a result of the excavation for the Visitors' Centre at the Fort York National Historic Site (AjGu-26).

Volume 2 (ASI 2013) of this report comprises the detailed artifact catalogue for this project.

2.0 PROJECT BACKGROUND

2.1 Previous Archaeological Research

The study area is within the 18-ha Fort York National Historic Site that contains an enclosed War of 1812 fort and two parks (Garrison Common and Victoria Memorial Square) with historical and archaeological features. The Stage 1 assessment was prompted by planning for the construction of a proposed Visitors' Centre for Fort York (ASI 2008). The study area included the entire parking lot south of Garrison Road east of the entrance drive between Garrison Road and Fort York Boulevard. The inventory of historic features developed through map overlays and archival research included four buildings located within the Ordnance and Supply Yard for Fort York circa 1868-1923, the former surface of Garrison Road, and a Grand Trunk carriage house (ASI 2008:Table 2).

The Stage 2 assessment of the proposed Visitors' Centre documented numerous cultural features after the parking lot and landscape fills had been removed by a mechanical excavator from test units placed at 10 metre intervals across the project area, as then defined (ASI and Strata Consulting 2010). These included the presence of buried soil horizons that represent the nineteenth-century ground surface (Lots 12, 46, 47, 67, 75, 85, 95, 113, 122), some of which were physically modified by the impact of heavy vehicles during the time that they were exposed (Lots 16, 27, 29, 40); an engineered pavement of cobbles and split boulders (Lot 43) that defines the extent of the Ordnance yard as it was configured in 1868; evidence of wooden (Lots 21, 24) and brick (Lots 78, 81) foundations for military store buildings; ceramic drain pipes (Lots 44, 70, 97, 104, 121); a wooden box drain (Lot 216); a cistern (Lot 102); and the former surface of Garrison Road (Lots 209, 211). These remains were deemed to represent archaeological resources of sufficiently high cultural heritage value as to merit Stage 4 mitigation of the impacts of the proposed development (ASI and Strata Consulting 2010:45).

It should be noted that the Stage 2 assessment report was made available to the architectural firms that were invited to bid on the design of the new Visitors' Centre. The winning design has sited the building such that the major portion is located below the sensitive tableland of the former Garrison Common and the Ordnance and Supply Yard, and within the lands cut and filled for the Gardiner Expressway and the made lands resulting from lake filling for the Grand Trunk railway bed. Therefore, the boundary of the present Stage 4 study differs considerably from that presented in the Stage 1 and Stage 2 reports (Figure 2).

Figure 2: The Stage 4 excavation trenches relative to the Fort York Visitors' Centre impact zone and the Stage 2 archaeological excavations within the Ordinance and Supply Yard.

2.2 Land Use History

A general overview of the history of the site is provided in the Stage 1 report (ASI 2008) and elaborated on further in the Stage 2 report (ASI and Strata Consulting 2010). The subject property is located west of the walled fort on the former tablelands that rose above the Lake Ontario shore, now known as the Garrison Common. The lake and Garrison Creek located to the east would have made the area an attractive camp site for native people. Unfortunately, the later development of the area has destroyed much of the evidence of their occupation.

In 1793, the Town of York was established by Lieutenant-Governor Simcoe with the proposed intention of making it a military and naval arsenal of the new province of Upper Canada. Thus, the town was confined to a small area now bounded by Front, George, Duke, and Berkley Streets while a garrison maintained control of lands centred on Garrison Creek that functioned as the Military Reserve. The land that Fort York was built on was generally of low relief, boggy, and poorly drained. Early historic maps and sketches depicted several small creeks and gullies flowing through the area (Figure 3).

Figure 3: The *Plan of York* surveyed and drawn by Lieut. Phillpotts, Royal Engineers, 1818 (left), and Sir Richard Bonnycastle's 1833 *No. 1 Plan of the Town and Harbour of York, Upper Canada* (right), both showing gullies and streams cutting through Garrison Common.

In the early 1800s, much of the fort was located on the east side of Garrison Creek, rather than being in the location of present-day Fort York. Then, on April 27, 1813 the area witnessed a battle between American and British/Canadian troops and their native allies. The British and allied forces carried out a fighting retreat from the present-day Dowling Avenue to Fort York. The end of the battle came when the British commander, Sir Roger Sheaffe, ordered the detonation of the grand powder magazine located south of the Government House under the present-day Fort York ramparts (Benn 1993).

The American forces were approximately 180 metres from the Grand Magazine and the resulting explosion killed or wounded 250 Americans troops, including their field commander, Brigadier-General Zebulon Pike (Cruikshank 1902:183; Benn 1984:56; Benn 1993:55-56; Malcomson 2008:218). The debris field of the magazine explosion is estimated to have been in the order of 450 metres in radius (Malcomson 2008:216-217). Archaeological excavations within the fort have resulted in the recovery of numerous distorted metal objects, such as cuprous powder barrel hoops, scattered by the explosion (David Spittal, personal communication, 2005). The current project is approximately 260 metres away from the former location of the Grand Magazine and would thus have been well within the blast radius.

The fort was rebuilt between the summer of 1813 and 1816 on the west side of the creek (Benn 1993:69-70). Many of the present-day fortifications and structures were built during this time period.

After the New Fort was constructed on the lakeshore in 1841, the Garrison Road was constructed to link the new garrison facilities with the "Old Fort." The present-day Garrison Road lies directly north of the study area though the historic maps depict various alignments. Previous road surfaces of Garrison Road were picked up during the Stage 2 assessment in an area west of the entrance drive between Garrison Road and Fort York Boulevard (ASI and Strata Consulting 2010:37).

In the 1850s, lands directly north, south, and east of the fort were acquired by various railway companies who initiated a period of lake filling projects.

In 1868, the first buildings were constructed in the area that made up an Ordnance and supply yard. These facilities consisted of a military store, an office, a gun carriage shed, an unidentified structure, and a variety of smaller buildings such as a wood shed, a privy, a pump, and a pump tank all enclosed by a wooden fence (Figure 4). The area measured 120 feet parallel to the Garrison Road by 100 feet perpendicular to Garrison Road. The north-east portion of the Visitors' Centre footprint intersects the military store that was located on the west end of this compound. This structure, enumerated as the "#14 Frame Building" in the 1933

Figure 4: Ordnance and Supply Yard around 1871 from *Toronto, Old Fort Plans Shewing the Buildings and Works Coloured Red on the Military Reserve at the Expense of the Imperial Government Since 1861.*

Ordnance Buildings survey of Fort York, was described as being of panelled upright dressed lumber with two brick chimneys and a post foundation (City of Toronto 1933).

In 1870, the British government transferred control of all secondary North American garrisons, such as Toronto, to the new Canadian federal government. Many of the newly formed Canadian military units received their training at Fort York (Benn 1993:130). Later, Fort York was used as offices for military staff, married quarters for officers, and served as an ammunition and artillery depot for the region (Benn 1993:132). Toward the end of the nineteenth century, the office on the east side of the Ordnance yard may have been converted into a residence. By the end of the nineteenth century, water infrastructure was installed across the compound as a photograph from 1899 depicts a fire hydrant (Plate 1).

Plate 1: Ordnance and Supply yard around 1899, note the fire hydrant to the left and a child on the shoulder of the man on the left of the group.

Around the First World War (1914-1918), the Ordnance and Supply Yard was extended westward into most of the current study area and three new structures were added (Figure 5). The first was an expansion to the military store. It consisted of a 26 by 40 feet annex with Manitoba siding, a shingle roof, and a post foundation. The second structure measured 40 by 30 feet and was probably the carpenter shop enumerated in the Ordnance Buildings survey of 1933. It was described as a frame building on a post foundation with stove pipe chimneys used for heat during cold weather. A third structure was added after 1921, as it is not present on the 1921 map of the yard (City of Toronto 1921). It measured 10 by 12 feet with a sloped roof and three walls made of galvanized iron, with the fourth side left open. The building was held up by a frame of two by four inch scantlings and served as a forge (City of Toronto 1933). The enlarged compound continued to be enclosed by a fence. A photo from 1926 illustrates the western corner of the new Ordnance and Supply Yard compound including its fence (Plate 2).

Plate 2: The west corner of the expanded Ordnance and Supply yard in 1926. The carpenter shop is to the right.

| | |
| Fence | Military Stores |
| | |
| | 14 |

Figure 5: Plan of the Ordnance and Supply Yard in 1935 with new fence and structures identified.

A letter from the Department of Buildings, City of Toronto indicates that the abandonment and demolition of these structures was completed by February 6, 1936 (City of Toronto 1936). The aerial photography suggests that grass was allowed to grow over the area occupied by the Ordnance and Supply Yard (Plate 3). This remained unchanged until 1960 when the Gardiner Expressway was constructed. It destroyed any potential archaeological remains in the south half of the Visitors' Centre footprint. The activities surrounding the construction of the Expressway also added new fill layers to what remained of the former Ordnance and Supply Yard as the photographic evidence from the 1960 construction displays no evidence of the grass that covered the area the previous year (Plate 4).

2.3 **Physical Setting of the Project Area**

The proposed Visitors' Centre footprint encompasses a small portion of the gravel parking lot west of the walled fort, south of Garrison Road and east of the entrance driveway that extends between Fort York Boulevard and Garrison Road. It also straddles the driveway and includes land west of the entrance drive that is green space landscaped on fill from the Gardiner Expressway construction in the 1960s. The northern limits are partially defined by a high voltage power line that extends along the south shoulder of Garrison Road, and includes a small fraction of the tableland of Garrison Common upon which the 1868-1936 Ordnance and Supply Yard was constructed for Fort York.

Page 6

Plate 3: Aerial photograph of Fort York in 1959. Study area on the far left, south of Garrison Road. Note that the area is covered with grass.

Plate 4: Gardiner Expressway under construction by Fort York in 1960, looking east. Note ground surface change and construction facilities over the former Ordnance and Supply Yard area in the centre of the photo.

The Visitors' Centre will largely occupy the slope up to the tableland, as well as the lake fill at the bottom of the slope underneath the Gardiner Expressway. The slope is an artificial landscaped feature that is the proxy for the original Lake Ontario shoreline and it will be removed or remodeled by the development. The building will also necessitate the removal of the current entrance drive that connects Fort York Boulevard to Garrison Road.

3.0 **RESEARCH METHODOLOGY**

3.1 Introduction

The Stage 4 field excavations were undertaken between July 21, 2010 and July 12, 2011. Work was not carried out on any days when weather conditions were inappropriate. The Stage 4 excavations involved the use of a Cat 312 track excavator equipped with a smooth bucket to remove upwards of one metre of the gravel parking lot surface and the clay fill supporting it under the supervision of Dr. Andrew Stewart and Ms. Eva MacDonald (Plates 5 - 7). The excavation was carried out systematically from east to west in four contiguous trenches after the maximum construction impact area had been staked in the field (Figures 2, 6, and 7). These stakes were used to guide the placement of the trenches to ensure that only the area of construction impact was excavated (Plate 6). Profile drawings were made of all the trenches.

The mechanical excavations were halted when the surface of the archaeological strata were exposed. Horizontal control was maintained through the establishment of a recording grid tied to a datum stake labeled 700N-300E that corresponded to the surveyor's stake labeled #105 on the plan of the Visitors' Centre supplied by the construction project management firm O. P. McCarthy and Associates.

The Parks Canada convention of designating each unique stratigraphic unit as a "lot" was followed during the excavation and recording process, with a lot comprising either a modern paving, an occupation level, a fill, a buried sod, an interface, an artifact (or cluster of artifacts), an intrusion, a cultural feature, a natural stratum, a sample, or any other phenomenon the archaeologist believes should receive individual analysis (Cary and Last 2007). Lot numbers assigned during the previous phase of work were retained if those contexts were encountered, e.g. Lot 43 the engineered pavement of the Ordnance and Supply Yard, otherwise new numbers were assigned beginning with Lot 300 in Trench 1.

All artifacts recovered during the excavations were retained for analysis. Representative scale drawings of structural elements, stratigraphic deposits, etc. were completed and their attributes recorded (Figure 8). A complete photographic record of the excavation process was maintained.

Upon completion of the field work, the excavation area was backfilled.

3.2 Trench 1

Field work took place in Trench 1 between July 21 and July 27, 2010. The trench measured 31 m long and between 2 and 3 m wide, with the north edge conforming to the northeast edge of construction impact (Figure 2). The cut for the Gardiner Expressway (Lot 92) defined during the Stage 2 assessment was documented along the southern edge of Trench 1 and no excavation was conducted south of this edge of previous construction disturbance. No buried soil horizon (with the exception of what was preserved under the engineered pavement noted below) was detected in this trench (Figure 9) possibly reflecting impacts to the former Ordnance and Supply Yard during the construction of the Gardiner Expressway.

Numerous cultural features were documented in the trench, primarily as cuts made into the exposed subsoil (Lot 303); the latter is described as a non-organic clay attributed to Sunnybrook Till. The features included two round piles for the military store with wood intact (Lots 312, 318), a trench (Lot 313) containing a brown-glazed ceramic pipe with bell and hub connectors marked "Mimico" (Lot 320), a sand-filled pit (Lot 315) with two steel grounding rods (Lots 314) related to a former utility line that ran across Garrison Common in the 1950s, and a cache of unfired ordnance within a former military store

St J.

foundation pile (Lot 317). The trench also contained a portion of the engineered pavement (Lot 43) documented during the Stage 2 assessment (ASI and Strata Consulting 2010:20), but it had been previously impacted by events that included the deposition of concrete (Lot 306).

With the exception of the utility line grounding rods, examples of which were examined in Trenches 3 and 4, each cultural feature was mapped, sectioned, and photographed and 100 percent excavated. All fills were screened through 6 mm wire mesh and the artifacts were bagged according to the lot provenience. The west, north, and east wall profiles were cleaned by hand, photographed, and the profiles were drawn at 1:200 scale (Figures 8 and 9). Upon the completion of this work, the trench was completely backfilled with the excavated material and the gravel replaced.

3.3 Trench 2

Field work took place in Trench 2 between July 28 and August 20, 2010. The trench measured 10.5 m wide north-south and 6.5 m long east-west, with the north edge conforming to the north limit of construction impact (Figure 2). The cut for the Gardiner Expressway (Lot 92) defined during the Stage 2 assessment was documented along the southern edge of Trench 2, and the trench was not extended south of this edge of previous construction disturbance (Figure 7).

Mechanical excavation was halted when a buried dark brown silty clay loam soil layer (Lot 321) was exposed uniformly across the trench at a depth that ranged between 82.05 and 82.25 m asl. The lot is correlated to those documented during the Stage 2 assessment (Lots 27, 29, 40) as a possible buried A-horizon that has undergone considerable turbation or compaction from foot traffic or heavy equipment, as well as enrichment from the addition of quantities of coal ash (ASI and Strata Consulting 2010:18). The block excavation of one-metre square units tied to the recording grid proceeded beginning August 3. Each unit was excavated stratigraphically to subsoil and fills screened through 6 mm wire mesh (Plate 8). All artifacts were bagged according to the one-metre square provenience and the lot designation. A total of 54 one-metre squares was excavated.

The basic stratigraphy comprised a 10-40 cm thick enriched and compacted soil layer (Lot 321) that overlay a non-organic brown silty clay (Lot 322) interpreted as a B-horizon that contained a limited amount of artifacts. This layer was excavated until the clay graded to a lighter colour and became sterile (Lot 303). The majority of the lots were discernible in contrast to Lot 322 (Figure 7) as irregular deposits of soil and artifacts (Lots 323, 325, 326, 327, 330, 331, 334, 336, 337, and 338) that represent refuse-filled depressions rather than deliberately excavated trash pits. One possible deliberately created refuse pit was identified – Lot 332. A trench (Lot 329) containing a glazed ceramic pipe with bell and hub connectors was also documented and extended into Trench 3.

With the exception of the utility trench, which was 50 percent excavated, each cultural feature was mapped, sectioned, and photographed and 100 percent excavated. All soil fills were screened through a 6 mm wire mesh and the artifacts were bagged according to the lot provenience. The west, north, and east wall profiles were cleaned by hand, photographed, and the profiles were drawn at 1:200 scale (Figures 8 and 10).

Upon the completion of this work, the trench was completely backfilled with the excavated material and the gravel replaced.

Figure 10: Trench 2 profiles from the Stage 4 excavation of the Fort York Visitors' Centre.

3.4 Trench 3

Field work took place in Trench 3 between August 23 and October 26, 2010. The trench measured 9.0 m wide north-south and 13.5 m long east-west, with the north edge conforming to the north limit of construction impact (Figure 2). The cut for the Gardiner Expressway (Lot 92) defined during the Stage 2 assessment was documented along the southern edge of Trench 3, and the trench was not extended south of this edge of previous construction disturbance (Figure 7).

Mechanical excavation was halted when a buried silty clay loam soil layer was exposed uniformly across the trench at a depth that ranged between 82.54 and 82.71 m asl. It was designated as either Lot 359 or Lot 321 depending upon the degree to which coal inclusions were present. The block excavation of one-metre square units tied to the recording grid proceeded beginning August 24. Each unit was excavated stratigraphically to subsoil and soil fills screened through 6 mm wire mesh. All artifacts were bagged according to the one-metre square provenience and the lot designation. A total of 120 one-metre squares was excavated, not including units excavated during the Stage 2 assessment.

The basic stratigraphy in this trench differed slightly from that of Trench 2. Lot 359 overlay one or more additional cultural strata including a buried topsoil (Lot 354) that correlates with Lot 321. These overlay the non-organic brown silty clay (Lot 322) interpreted as a B-horizon that contained a limited amount of artifacts. Lot 322 was excavated until the clay graded to a lighter colour and became sterile (Lot 303). In some places, this B-horizon appeared to fill natural swales in the sterile substrate, providing further evidence of the gullies in the former landscape (c.f. ASI and Strata Consulting 2010:40). These additional layers helped to raise the grade by 50 cm in what would have been the west half of the Ordnance and Supply Yard.

The remains of numerous round piles (Lots 360, 363, 367, 369, 370, 371, 373, 376, and 379), three square posts (Lots 339 and 368), a rectangular pit (Lot 374), an irregular concrete conglomerate (Lot 350), a trench (Lot 341; correlated with Lot 329) with a ceramic pipe with bell and hub connectors (Lot 361), and two utility pole base features (Lots 314, 340, 342, 346, and 351) were documented as cuts made into Lot 322.

Each cultural feature was mapped, sectioned, and photographed and 100 percent excavated. All soil fills were screened through 6 mm wire mesh and the artifacts were bagged according to the lot provenience (Plate 9). The west and north wall profiles were cleaned by hand, photographed, and the profiles were drawn at 1:200 scale (Figures 8 and 11).

Upon the completion of this work, the trench was completely backfilled with the excavated material and the gravel replaced.

3.5 Trench 4

Field work took place in Trench 4 between November 5, 2010 and July 12, 2011. No excavation occurred between December 6, 2010 and May 10, 2011 either because of frozen or wet ground. The trench measured 9.0 m wide north-south at its maximum and 13.0 m long east-west, with the north edge conforming to the north limit of construction impact (Figure 2). The cut for the Gardiner Expressway (Lot 92) defined during the Stage 2 assessment was documented along the southern edge of Trench 4, and the trench was not extended south of this edge of previous construction disturbance (Figure 7).

Figure 11: Trench 3 profiles from the Stage 4 excavation of the Fort York Visitors' Centre.

Mechanical excavation was halted when a buried silty clay loam soil layer (Lot 301) was exposed uniformly across the trench at a depth between 82.00 m and 82.14 m asl. The block excavation of onemetre square units tied to the recording grid proceeded beginning November 8, 2010. Each unit was excavated stratigraphically to subsoil and soil fills screened through 6 mm wire mesh. All artifacts were bagged according to the one-metre square provenience and the lot designation. A total of 116 one-metre squares was excavated, not including units excavated during the Stage 2 assessment.

Lot 301 overlay either a demolition layer (Lot 362) related to the removal of the Ordnance and Supply Yard circa 1936, or the prepared surface (Lot 389) laid down after the demolition. These in turn overlay the natural cultural strata documented elsewhere, including a buried A-horizon (Lot 390), and a non-organic brown silty clay B-horizon (Lot 322 and Lot 391). Given the experience of finding a limited amount of artifacts in Lot 322, Lot 391 also was excavated until the clay graded to a lighter colour and became sterile (Lot 303).

The remains of numerous round piles/posts (Lots 382, 394, 395, 399, 401, 406, 416, 421, 422, 426, 429, 432, 434, 436, 438, and 439), two square posts with wood intact (Lots 414 and 419), one refuse-filled depression (Lot 386), and another example of a utility pole base feature (Lots 314, 402, and 403) were documented in Trench 4. Each cultural feature was mapped, sectioned, and photographed and 100 percent excavated. All soil fills were screened through 6 mm wire mesh and the artifacts were bagged according to the lot provenience. The west and north wall profiles were cleaned by hand, photographed, and the profiles were drawn at 1:200 scale (Figures 8 and 12). Upon the completion of this work, the trench was completely backfilled with the excavated material and the gravel replaced.

4.0 SETTLEMENT PATTERNS

The area impacted by the excavation consisted of the western-most section of the Ordnance and Supply Yard including a small sliver of the interior of the circa 1868 configuration of the yard and the military store. However, most of the block excavation area focused west of the military store in an area that was added to the yard during the First World War (Figure 5). This includes the building that has been interpreted as the 1910s-1936 carpenter shop and the 1921-1936 forge along with the western boundary fence. A portion of the area west of the Ordnance and Supply Yard also fell within the Stage 4 excavation boundaries (Figure 6).

4.1 Lots

The Stage 4 salvage excavation recorded a total of 152 individual lots (Figures 7, 9 - 12). Details of these lots are summarized in Table 1 below. These lots can be roughly divided into five separate components:

(1) the soil, including various soil horizons that existed before the construction of the Ordnance and Supply Yard, and additions made to the topsoil during its operation;

(2) the circa 1868 configuration of the Ordnance and Supply Yard consisting of the military store

building, the paved surface, and the Lot 313 utility trench;

(3) the 1910s-1936 Ordnance and Supply Yard expansion;

(4) the soil horizons outside the Ordnance and Supply Yard;

(5) and the post-1936 deposits.

These components will be discussed in the subsequent sections.

Figure 12: Trench 4 profiles from the Stage 4 excavation of the Fort York Visitors' Centre.

| | Table 1: Master List of Lots for the Fort York Visitors' Centre Excavation | | | | |
|------------|---|---------|----------|--|--|
| Lot | Composition | Trench | Munsell | Interpretation | |
| 1 | Dark brown pebbly clay loam with sub angular and rounded pebbles | 2 – 4 | 10YR 3/2 | Fill | |
| 2 | Grayish brown sand and gravel | 1 – 4 | - | Fill underlying the asphalt for the parking lot | |
| 3 | Coarse gravel with very pale brown sand | 1 – 4 | - | Fill underlying the finer gravel for the parking lot | |
| 15 | Yellow brick fragments | 3 | - | Fill over Lot 341 | |
| 30 | Dark grayish brown pebbly loamy sand | 2 – 3 | 10YR 5/3 | Post-1960 Gardiner Expressway construction fill | |
| 43 | Angular shale boulders with rounded cobbles | 1 | - | Ordnance and Supply Yard pavement | |
| 92 | Medium brown sand, gravel, and cobbles | 1 – 4 | - | Gardiner Expressway cut and fill trench | |
| 300 | Dark brown non-organic pebbly sandy loam | 1 | 10YR 3/3 | 1960s Gardiner Expressway construction fill | |
| 301 | Very dark gray sandy organic soil mottled with pebbles and clay | 1 | 10YR 3/1 | Post-Ordnance and Supply Yard A- horizon | |
| 302 | Flat shale pebbles | 1 | - | Ordnance and Supply Yard demolition fill | |
| 303 | Brown silty clay loam | 1 | 10YR 4/3 | Sterile transition between B- and C- horizons, minimally weathered | |
| 304 | Dark brown silty clay loam | 1 | 10YR 3/3 | Sunnybrook Till Organics leached from an overlying organic layer (Lot 301) | |
| 305 | Dark sandy organic soil with fired soil and water-worn pebbles | 1 | 10YR 2/1 | Irregular organic lens | |
| 306 | Iron-stained pebbles and concrete chunks | 1 | - | Later accretion to the Lot 43 pavement | |
| 307 308 | Dark grayish brown silty clay Metal lid | 1 1 | 10YR 4/2 | Ordnance and Supply Yard fill Indeterminate object in the profile | |
| 309 | Very dark gray organic lens coarsely mixed with charcoal, ash, decayed wood, and silty clay | 1 | 10YR 3/1 | Staining from the Lot 312 pile | |
| 310 | Brown sand | 1 | 10YR 4/3 | Fill under the parking lot surface | |
| 311 | Wood | 1 | - | Wooden frame buttress for Lot 314 grounding rods within Lot 315 | |
| 312 | Wood; 20 cm diameter dressed log | 1 | - | Pile for the military store | |
| 313 | Brown silty clay loam | 1 | 10YR 5/3 | Trench cut and fill for Lot 320 | |
| 314 | Two three cm-diameter metal rods | 1, 3, 4 | - | Grounding rods associated with utility poles | |
| 315 | Very pale brown sand coarsely mixed with angular gravel and dark sandy soil | 1 | 10YR 7/3 | Sand fill around the Lot 314 rods | |
| 316 | Brown silty clay | 1 | 10YR 4/3 | B-horizon beneath Lot 43 | |
| 317 | Decayed wood and black organic soil | 1 | 10YR 2/1 | Former pile for the military store with a cache of unfired training rounds | |
| 318 | Tapered, dressed log with black organic soil | 1 | 10YR 2/1 | Pile for the military store | |
| 319 | Concrete | 1 | - | Base to modern post | |

Table 1: Master List of Lots for the Fort York Visitors' Centre Excavation

| | Table 1: Master List of Lots for the Fort York Visitors' Centre Excavation | | | | |
|-----|---|--------|----------|---|--|
| Lot | Composition | Trench | Munsell | Interpretation | |
| 320 | Glazed ceramic pipe, four-inch interior diameter with impressed "MIMICO" diamond-shaped mark, "bell and hub" type connection | 1 | - | Waterline for the fire hydrant seen in Plate 1 | |
| 321 | Very dark gray silty loam mixed with rounded pebbles, gravel, and coal lenses | 2, 3 | 10YR 3/1 | Cumulative A-horizon of buried soil | |
| 322 | Brown silty clay loam coarsely mixed with pebbles and cobbles | 2 – 4 | 10YR 5/3 | B-horizon of buried soil with artifacts | |
| 323 | Dark yellowish brown silty clay loam | 2 | 10YR 4/3 | Refuse-filled depression | |
| 324 | Concrete | 2 | - | Iron-stained mass of degraded concrete | |
| 325 | Dark gray clay | 2 | 5Y 4/1 | Refuse-filled depression | |
| 326 | Dark grayish brown organic soil | 2 | 10YR 3/2 | Refuse-filled depression | |
| 327 | Dark reddish gray silty clay loam | 2 | 5YR 4/2 | Refuse-filled depression | |
| 328 | Grayish brown clay loam mottled with pebbles | 2 | 10YR 5/2 | Indeterminate deposit | |
| 329 | Sand coarsely mixed with charcoal, plaster, wood, pebbles, and cobbles | 2 | - | Trench cut and fill for Lot 361; equivalent to Lot 341 in Trench 3 | |
| 330 | Very dark grayish brown silty clay loam | 2 | 10YR 3/2 | Indeterminate fire reddened deposit | |
| 331 | Black organic soil | 2 | 10YR 2/1 | Charcoal-stained depression | |
| 332 | Dark yellowish brown organic soil mottled with red brick frags, coal, slag, glass, and metal | 2 | 10YR 4/4 | Refuse-filled depression | |
| 333 | Brown sandy clay loam coarsely mixed with angular pebbles | 2 | 10YR 5/3 | Post-1960 fill lens | |
| 334 | Very dark grayish brown soil mottled with charcoal and brick | 2 | 10YR 3/2 | Refuse-filled depression | |
| 335 | Metal | 2 | - | Sheet of metal | |
| 336 | Light brownish gray silty clay | 2 | 10YR 6/2 | Refuse-filled depression | |
| 337 | Black organic soil | 2 | 10YR 2/1 | Indeterminate depression | |
| 338 | Very dark gray clay loam mixed with rubble | 2 | 5YR 3/1 | Refuse-filled depression | |
| 339 | Ash | 3 | - | A pair of post moulds | |
| 340 | Wood; two-inch by four-inch lumber stacked vertically and nailed to uprights | 3 | - | Wood frame buttress for utility pole | |
| 341 | Sand coarsely mixed with charcoal, plaster, wood, pebbles, and cobbles | 3 | - | Trench cut and fill for Lot 361; equivalent to Lot 341 in Trench 2 | |
| 342 | Pebbly, sandy clay | 3 | 10YR 4/6 | Builders trench fill for utility pole associated with Lot 340 | |
| 343 | Ash mixed with coal and clinker | 3 | - | Thin lens | |
| 344 | Black silty loam mottled with wood and charcoal | 3 | 10YR 2/1 | Indeterminate organic lens, most likely postdating 1936 | |
| 345 | Dark yellowish brown silty clay loam | 3 | 10YR 4/4 | Layer beneath Lot 344 | |
| 346 | Sand | 3 | 10YR 4/6 | Builders trench for the utility pole associated with Lot 351 | |
| 347 | Very dark grayish brown silty loam coarsely mixed with sand, wood, and charcoal | 3 | 2.5Y 3/2 | Shallow concentration of iron and charcoal staining under Lot 344 | |
| 348 | Very dark grayish brown pebbly sand and silt mixed with chert and limestone gravel | 3 | 10YR 3/2 | Fill related to the Gardiner Expressway construction | |

Table 1: Master List of Lots for the Fort York Visitors' Centre Excavation

4.2 Pre-Ordnance and Supply Yard

Four lots were identified in the area of Ordnance and Supply Yard that represent horizons of one or more natural soils existing at the time of the yard's construction – Lots 303, 316, 321, and 322. While the construction of the Ordnance and Supply Yard introduced new artifacts and intermixed the naturally-deposited material in these lots, their sequence represents the natural stratigraphy and soil development prior to the construction of the compound.

Lot 303 consists of the sterile brown silty clay loam subsoil representing the transition between the lower B-horizon to upper C-horizon in Sunnybrook Till. Lot 316 was identified in Trench 1 under Lot 43, an engineered surface first identified during the Stage 2 assessment (ASI and Strata Consulting 2010:32) that will be discussed in more detail in Section 4.3 below. Lot 316 consists of brown silty clay and represents the original B-horizon before the construction of the Lot 43 pavement. Lot 322 is similar to Lot 316. Lot 322 is the upper part of the B-horizon beneath most of the Ordnance and Supply Yard. It consists of brown silty clay loam coarsely mixed with pebbles and cobbles. The bottom of this layer was sometimes uneven and a relic gully was identified in Trench 3 during the excavation (Plate 10).

Lot 321 was observed as a very dark gray silty clay loam layer mixed with rounded pebbles, gravel, and coal lenses. In most units between the military store and the carpenter shop and forge, Lot 321 contained a distinct lens of gravel right above Lot 322. This most likely represents a deposited gravel working surface (Plate 11). Lot 321 is interpreted as the active, cumulative A-horizon (acquiring sedimentary material unevenly) present before and during the operation of the Ordnance and Supply Yard. This lot is present in almost every unit in Trenches 2 and 3 with the exception of units overlying Lot 353 and some eastern units within the carpenter shop where Lot 359 is present. Thus, it is possible that Lot 321 and 359 are the same layer with the latter only being darker and with demolition debris in the form of brick fragments.

It is important to note that, with the exception of where Lot 43 is present and has capped the B-horizon (Lot 316), the older section of the Ordnance and Supply Yard lacks a Lot 322 or Lot 354 equivalent. This indicates that the construction of this part of the yard removed all traces the previous soil development.

Twelve pits and depressions, many of them filled with refuse, were identified within the stratigraphic layers. These consisted of Lots 323, 325, 326, 327, 330, 331, 332, 334, 336, 337, 338, and 386 (Figure 13; Plates 12 - 15). These displayed a wide variety of sizes that ranged from 19 cm to 100 cm in length, 12 cm to 60 cm in width, and four cm to 32 cm in depth. The sizes of the different depressions and pits are summarized in Table 2 below.

It is worthwhile to discuss Lot 332 in detail. This dark yellowish brown deposit was 95 cm in length, 90 cm in width, and 28 cm deep. As shall be discussed in Section 6.3.5, it contained three unique, mostly complete vessels and one complete kettle, among other artifacts (Plate 15). The chronologically diagnostic artifacts from this lot have a tight date around or slightly before 1830. This suggests that, instead of being a refuse-filled depression whose fill accumulated gradually, this was a discrete refuse pit created in the first few decades of Fort York's existence when it still served its primary function of defence for Upper Canada's capital.

Figure 13: Examples of refuse-filled depressions from the Stage 4 excavation for the Fort York Visitors' Centre.

| Lot Number | Maximum Length | Maximum Width | Maximum Depth |
|------------|----------------|---------------|---------------|
| 323 | 30 cm | 25 cm | 5 cm |
| 325 | 100 cm | 25 cm | 22 cm |
| 326 | 58 cm | 30 cm | 15 cm |
| 327 | 100 cm | 58 cm | 32 cm |
| 330 | 35 cm | 24 cm | 10 cm |
| 331 | 35 cm | 30 cm | 6 cm |
| 332 | 95 cm | 90 cm | 28 cm |
| 334 | 68 cm | 48 cm | 11 cm |
| 336 | 19 cm | 14 cm | 5 cm |
| 337 | 16 cm | 16 cm | 4 cm |
| 338 | 50 cm | 44 cm | 6 cm |
| 386 | 52 cm | 48 cm | 9 cm |

Table 2: List of Depressions at the Fort York Visitor Centre Excavation

The proliferation of the non-pit features points to a boggy, uneven terrain around Fort York that can be seen in the historic images and accounts from the period. These depressions would have been filled up opportunistically with refuse throughout the utilization of the fort. The unevenness of the original landscape can also be seen through a gully and several wagon tracks observed during the excavation where material from the upper lots was pushed down into the lower strata, as well as the presence of Lot 385, fill specifically deposited in the natural crevices to level the ground surface for the construction of the carpenter shop. Lot 385 will be discussed in further detail in Section 4.4.1 below.

4.3 Circa 1868 Configuration of the Ordnance and Supply Yard

The eastern section of the excavation in Trench 1 documented features with the original configuration of the Ordnance and Supply Yard, which is represented by nine lots: 43, 306, 309, 312, 313, 317, 318, 319, and 320.

A small portion of Lot 43, the engineered pavement in the Ordnance and Supply Yard that was first identified during the Stage 2 assessment, was uncovered in the east end of Trench 1. It consisted of angular and rounded cobbles and split boulders, approximately 15-40 cm in diameter. The pavement did not extend further west than it was mapped during the Stage 2 assessment and was disrupted by the construction of the Gardiner Expressway. Lot 43 was impacted also by Lot 306, a concrete conglomerate, and was cut by an indeterminate concrete post base, Lot 319 (Plate 16).

Adjacent to the engineered surface was a small section of the large military store that, at the Ordnance and Supply Yard's inception, represented the westernmost building of the yard. The east wall of this building was delineated by two piles sunk in the ground – Lot 312 and Lot 318. Lot 312 was 20 cm in diameter and 84 cm in depth (Figure 14; Plate 17). Lot 318 was 16 cm in diameter and 28 cm in depth and contained a stabilizing, rock support base (Plate 18). Lot 312 was also surrounded by Lot 309, a thin organic layer that might have resulted from soil staining around the Lot 312 pile. Lot 317 was a 30 cm by 25 cm rectangular post mould that was 44 cm deep (Plate 19). This may have been one of the piles for the military store that was later removed and filled with military Ordnance that will be discussed in Section 7.2. It should be noted that the west wall of the military store was not identified during the excavation and it is likely that the construction of a utility pole discussed in Section 4.6 impacted its remains.

Figure 14: Lot 312 profile, looking at north half.

The eastern edge of the excavation area uncovered a ceramic pipe trench, Lot 313. The trench was 60 cm in width and went down to a depth of 27 cm. The excavation of the trench exposed Lot 320, a brownglazed ceramic pipe one inch thick with an internal diameter of four inches (10.2 cm) and laid in sections with "bell and hub" connectors (Figure 15; Plate 20). Each of the ceramic pipe segments had an imprinted diamond-shaped mark with the word "MIMICO." This indicates that the pipe was manufactured by The Ontario Sewer Pipe and Clay Products Co. in Mimico, now in present-day Etobicoke. The Ontario Sewer Pipe and Clay Products Co. was founded in 1892 by Andrew Harris thus the pipe is not original to the Ordnance and Supply Yard (Millar 1925:452). Along with Lot 320, Lot 313 contained ceramic pipe sherds within its fill suggesting that the trench contained an earlier pipe before it was removed and replaced with a newer one. It is interesting to note that, given its orientation, Lot 320 may have serviced the water hydrant seen in Plate 1 and might be equivalent to Lot 44 observed during the Stage 2 archaeological investigation (ASI and Strata Consulting 2010:20).

4.4 1910s-1936 Configuration of the Ordnance and Supply Yard

The largest component of the Fort York Visitors' Centre excavation consisted of the lots associated with the circa 1910s-1936 carpenter shop, the 1920s-1936 forge, the extension of the fenced-in yard of the Ordnance and Supply Yard, and a few other lots associated with this area.

Lot 354 is an organic layer overlying Lot 322. This naturally-formed very dark gray silty loam was capped by the western part of the carpenter shop and then by the forge. Thus, like Lot 321, it was an active surface to which cultural material was added before the Ordnance and Supply Yard was extended to include the carpenter shop.

4.4.1 Carpenter Shop

The carpenter shop is the most distinct subcomponent of the Ordnance and Supply Yard expansion. The building is delineated by two parallel lines of piles located 10 metres apart – Lots 363 (Plate 21), 367, 369, 370, 371, 373, 375, 376, and 379 on the east and Lots 414, 426, 432 (Plate 22), and 436 on the west (Figure 7). Between these two rows is a third line of piles that divides the building in half and possibly demarcates two different rooms. These are represented by Lots 394, 395, 400 (Plate 23), 401, 406, and 416 (Figure 7).

Between the east wall and the midway point, four isolated piles were identified – Lots 360, 368, 382, and 424. In contrast, between the west wall and the midpoint, three piles form a line (Lots 421, 423, and 429). It is unlikely that the building contained smaller interior rooms given that a photograph of the building (Plate 2) portrays a double door on the north side of the building. The double door would have accommodated carriages and wagons thus placing room dividers on this side of the building would have been counterproductive.

Some of the piles were capped by a thin, usually inorganic, lens, probably a remnant of the demolition fill. A few others contained not only organic soil, or the post mould, but also substantial wooden remains of the piles. The carpenter shop piles are summarized in Table 3. The examples of some of these piles can be seen in Figure 16.

Figure 15: Lot 320 ceramic pipe within the Lot 313 trench.

Figure 16: Examples of piles for the carpenter shop within Fort York's Ordinance and Supply Yard.

| Table 3: Piles Associated with the Carp | enter Shop at the Fort York Visitors' Centre Excavation |
|---|---|
|---|---|

As can be seen by the table above, most of the piles were smaller than 20 cm in diameter and half displayed evidence of wood remains. The east wall of the shop contains more piles than the west, perhaps to support a wall being shared with the forge.

In addition to the piles, the carpenter shop was defined by three spreads of soil and eight smaller deposits. The spreads consisted of Lots 384, 385, and 393. The lowest of these layers was Lot 385, gray-blue silty clay that appears to occupy the natural crevices within Lot 322 in the southwest corner of the carpenter shop. On a few occasions it was also used as fill around the carpenter shop piles. This suggests that Lot 385 was an imported deposit of soil used to level the terrain before the construction of the carpenter shop. Some of this material was also used to buttress the carpenter shop piles. Lot 385 was sometimes capped by Lot 393 (Figure 12), a dark grayish brown deposit with pebbles that occupied the western section of the carpenter shop interior. Lot 384 abutted Lot 393 and was localized along the mid-point of the carpenter shop as a very dark gray silty loam deposit with pebbles (Plate 24). These large deposits suggest that the carpenter shop had no floor and thus these spreads may represent different activity areas within the shop that lead to the accumulation of different soil matrixes.

Smaller deposits consisted of Lots 345, 347, 352, 383, 398, 413, 418, 425, and 431. Of these, three were localized in the southeast corner of the carpenter shop in a small area around the base of a utility pole (Lot 346 and Lot 351). These lots consist of Lot 347, a very dark grayish brown silty loam coarsely mixed with sand, wood, and charcoal, and Lot 352, a homogenous dark gravish brown iron-stained lens. Lot 345 was a dark yellowish brown silty clay loam layer that underlay these lots and may have resulted from soil leaching.

Lot 383 was a thin layer adjacent to Lot 381 in the central section of the carpenter shop in unit 701N-282E and consisted of a dark brown silty clay loam deposit. Lot 398 was an area of discolouration in unit 700N-280E and 700N-279E and might have originated from leaching from the Lot 362 above. In unit 699N-277E, Lot 413 overlay the Lot 391 B-horizon discussed in Section 4.2 and represented a small deposit of organic silty loam. Finally, Lot 418, a fine, iron-stained, greasy sand, was imbedded into Lot 393 in three units in the northwest corner of the shop: 705N-278E, 706N-277E, and 706N-278E.

Lot 425 was located on the western section of unit 701N-276E and consisted of a non-organic coal ash lens with lots of glass, metal, shale, and slag. Lot 431 was a black organic iron-stained lens mottled with ash. Lot 425 overlay Lot 393 and Lot 431 overlay Lot 385 (Plates 25 and 26), and both were capped by Lot 362. Together, they may represent concentrated industrial refuse deposits placed beside the carpenter shop building.

4.4.2 Forge

Unlike the carpenter shop, the 1920s forge lacks extensive structural remains. Instead, the general location of the forge can be surmised largely by the spread of the smithing slag layer, Lot 353 (Plate 27), located northeast of the exposed portion of the carpenter shop. This layer extends from unit 702N-286E in the south, unit 705N-293E in the east, and along the 707N line between 285E and 293E. This slag layer is significantly larger than the 12 ft. by 10 ft. structure enumerated in the 1933 list of insured buildings in the Ordnance and Supply Yard (City of Toronto 1933) or seen in the 1935 map of the compound (Figure 5) indicating that the working surface and the debris were spread well beyond the structure. The extent of Lot 353 along with the major carpenter shop lots can be seen in Figure 17.

One place where a wall of the forge could be discerned was where it shared a common boundary with the carpenter shop (Figure 7). Here, piles (Lots 363, 367, 369, 370, 371, 373, and 376) straddled the transition between the shop and the Lot 353 spread. Given what was previously discussed about the larger quantities of piles observed in the east wall of the shop, some of these piles may have been used to tie the forge into the carpenter shop structure. The other wall segment of the forge comprised Lot 366, a preserved one-inch thick wood imbedded into Lot 354 in unit 704N-284E (Plate 28). These remains would have at one point divided the carpenter shop from the forge. Beyond this, the forge was built at grade with no significant subterranean features.

Within the Lot 353 spread, two lots were identified that may relate to the working area of the forge. Lot 364 had a strongly variegated colour and consisted of a brown silty clay coarsely mixed with organic soil and pebbles. It was stained heavily with iron and located directly on top of Lot 354. Lot 364 was present in three units - 705N-286E, 705N-287E, and 706N-286E (Plate 29). This lot abutted Lot 365, which consisted of organic loamy soil with ash and wood fragments possibly representing floor boards. A lens of red fired sand was present within this lot in unit 704N-287E. Lot 365 was present in units 704N-286E, 704N-287E, 705N-286E, and 705N-287E (Plates 30 and 31).

Figure 17: Significant soil horizons within the carpenter shop and forge at the Fort York National Historic Site.

Lots 364 and 365 represent the remains of the forge's working surface. The lens of red fired sand is particularly interesting. In a previous excavation of a mid-nineteenth-century blacksmith shop, the fill within the remains of the forge consisted of similar fired red sand (ASI 2012c:6). Thus, the lens points to the location of the forge within this structure and the immediate working area of the smith.

Two other lots (343 and 357) are probably associated with Lot 353. Lot 343 was a spread of ash and clinker in units 703N-290E and 704N-291E. This may have been a waste deposit from the forge operations. Lot 357 was an inorganic sand coarsely mixed with red brick in unit 702N-288E. It was sandwiched between the organic A-horizon (Lot 354) and the inorganic deposit of the forge (Lot 353), thus Lot 357 may have been a deposit to fill a depression before the construction of the forge.

4.4.3 Fence Expansion

The fence line of the expanded Ordnance and Supply Yard is delineated by three thick and deeply buried posts – Lots 434, 438, and 439 (Figure 7). These are summarized in Table 4.

| Idl | Table 4: Posts Associated with the rence at the post for visitors' centre excavation | | | | | | | | | |
|------------|--|-------|-----|--------------|--|--|--|--|--|--|
| Lot Number | Diameter | Depth | Сар | Decayed Wood | | | | | | |
| 434 | 17 cm | 52 cm | No | Yes | | | | | | |
| 438 | 22 cm | 52 cm | No | No | | | | | | |
| 439 | 25 cm | 50 cm | No | No | | | | | | |

Table 4: Posts Associated with the Fence at the Fort York Visitors' Centre Excavation

4.4.4 Other Lots Associated with the Expanded Ordnance and Supply Yard

Eight other lots were identified within the expanded Ordnance and Supply Yard that did not relate to any of the structural elements listed previously. The lots can be split between those located between the military store and the carpenter shop and forge (Lots 15, 328, 335, 339, 329/341, and 361) on the one hand, and those located between the carpenter shop and the fence line (Lots 408 and 409) on the other.

With respect to the former, Lot 328 was a grayish brown clay loam deposit mottled with pebbles that was observed in the profile of unit 704N-301E; it contained no artifacts and its nature could not be determined. Lot 335 was a sheet of metal found on top of Lot 322 in unit 704N-300E. It was recovered and bagged as a unique lot. Lot 339 consisted of two isolated ashy square posts in unit 700N-292E measuring nine by 14 cm.

Lot 341, first identified in Trench 2 as Lot 329, was the second of the two trenches containing ceramic pipes exposed during the excavation. The trench fill consisted of a mixed deposit of organic soil, clay, and sand coarsely mixed with red and yellow brick, charcoal, plaster, pebbles, and wood. Lot 329/341 contained Lot 361, a brown-glazed ceramic pipe one inch thick with an internal diameter of four inches (Plate 32). It is important to observe that given its orientation, the Lot 361 drain would not have serviced either the forge or the carpenter shop as it would have missed these two structures. Instead, it probably serviced the military store. Later it was truncated by the construction of the utility poles as the trench ends abruptly at the Lot 315 cut. Lot 15, a thin layer of crushed yellow brick, covered the top of Lot 341.

In the area between the carpenter shop and the fence of the Ordnance and Supply Yard, on the north edge of the Gardiner Cut in Trench 4, Lot 408, a grayish brown clay deposit mixed with blue clay, coal, coal ash, and iron slag, was present in four units along the 699N line between 274E and 277E. This limited

spread of soil was positioned stratigraphically above Lot 391 and its function has not been determined. Lot 409, a large boulder, was lodged within this context. The boulder was examined by Professor Joe Desloges of the University of Toronto who determined it was a large granite water-rolled boulder that did not display any modification by a person. It was not typical of till and was probably moved to that location from the lakeshore. Furthermore, it did not display any signs of trauma as it theoretically could have been stone ejected from the Grand Magazine during the explosion of April 27, 1813.

4.5 Exterior of the Ordnance and Supply Yard Compound

The western edge of the excavated area consisted of lots that were never part of the Ordnance and the Supply Yard enclosure. This area was comprised of four soil horizons (Lots 389, 390, 391 and 392) and three smaller deposits (Lots 405, 437, and 440). Lot 392 was a pale brown silty clay loam equivalent to the sterile lower B-horizon transition (Lot 303) within the till substrate identified underneath the Ordnance and Supply Yard. This was overlaid by Lot 391, the organic weathered upper B-horizon that contained artifacts, and which in turn was overlaid by Lot 390, an organic A-horizon of friable very dark gray loam that is equivalent to Lots 354 and 321. Lot 390 was capped by Lot 389, a prepared surface of yellowish brown silty clay that may be related to Lot 362 that overlays the carpenter shop deposits and will be discussed in the subsequent section (Plate 33).

Lot 405 was an isolated deposit of black gritty silty clay loam in the southeast corner of the excavation in unit 699N-269E. It was sandwiched between Lots 392 and 391. Lot 437 was also identified in unit 699N-269E as a thin lens of brown clay embedded into Lot 392. Lot 440 was a lens of friable organic yellow loamy sand mottled with non-organic clay that overlay Lot 391 in unit 702N-271E.

Overall, the stratigraphy within the western edge of excavation was representative of a gradual natural soil formation (horizonation) that halted when this area was capped with fill after the demolition of the Ordnance and Supply Yard.

4.6 Post-1936 Deposits

The post-1936 lots represent a wide variety of post-abandonment soil horizons, parking lot fills, utility posts, and small isolated deposits. There were four post-1936 soil horizons – Lots 359, 362, 304 and 301. The distributions of Lots 359 and 362 within the excavation area can be seen in Figure 18. Lot 362 was a dark yellowish brown sand layer that capped most of the carpenter shop soil layers (Plate 33). It exhibited iron staining and organic mottling. This deposit occupies the same stratigraphic position as Lot 389 and these were likely deposited at the same time after the Ordnance and Supply Yard was demolished as part of turning the land back into a green space.

The same demolition process did not occur over the forge and the eastern end of the carpenter shop which were capped by an organic layer, Lot 359. This deposit of black silty clay loam was of a homogenous composition with a few red brick fragments present (Plate 34). Within some sections of the carpenter shop it overlay the Lot 362 sand but Lot 359 was noticeably absent in conjunction with Lot 321. Lot 301 was a very dark gray sandy organic soil mottled with pebbles and clay layer that gradually formed over the *circa* 1868 buildings in Trench 1, and the First World War era buildings in Trench 4 after the 1936 abandonment. Lot 304, a layer directly below Lot 301, consisted of organics leached from this strata.

Figure 18: Significant post-1935 soil horizons at the Fort York National Historic Site.

A number of smaller deposits were associated with these post-1936 horizon layers. Among these is what was interpreted to be grounding rod constructs for four utility poles that can be seen in an 1959 aerial photograph of Fort York. The rods (Lot 314) were imbedded in pits filled with sand ranging from very pale brown to dark yellowish brown in colour (Lots 315, 342, 346, and 403). Each pit had a wooden retaining support wall (Lots 311, 340, 351, and 402). The walls consisted of 16 cm tall by 8 cm thick wooden beams supporting a few upright members into which the rods were grounded. The upright members also had one more horizontal beam at the base for added support (Figure 19: Plate 35). Lot 301 covered these features indicating that the soil had time to form before the parking lot fills were added.

Two other posts were identified directly below Lot 301 in this area, indicating their post-1936 date. Lot 412 was a 4.4 cm by 4.4 cm square surveyor's stake driven into the ground between Lot 385 and Lot 354 and Lot 362 in unit 699N-278E. The purpose of this stake is unknown. Another post was identified in unit 703N-278E. This post consisted of Lot 419, six inch (15.2 cm) by six inch (15.2 cm) square wood post with a metal rod. This post was dug deep into the Lot 322 B-horizon and was surrounded by Lot 420, a backfilled pit for the post consisting of fine, dark brown sandy loam mixed with pebbles, rocks, and brick fragments (Figure 20; Plate 36). The fill underlay Lot 301 indicating that it too was built before the construction of the Gardiner Expressway and the deposition of the parking lot fill. The same square also contained a pair of iron posts. These were observed but not given a lot number.

Within Lot 321 a few concrete conglomerates were identified. These were Lot 324 in unit 707N-297E, Lot 350 in unit 699N-290E, and Lot 355 in units 699N-287E and 699N-288E. The nature of these could not be identified beyond observing them to be imbedded in the Lot 321 A-horizon.

Another post-1936 deposit is Lot 374/381. When first identified, it was assumed that Lot 374 was a refuse-filled depression. Later, with the excavation of Lot 381 it was discovered that both were related to the same deposit and represent an unknown upside down L-shaped cut that starts in units 705N/706N-284E, runs west to unit 706N-281E, and then goes south to unit 701N-282E (Figure 7). This lot cut Lot 354 but a portion of Lot 362 is deposited within and around the deposit indicating that the operation had to have been conducted as the Ordnance and Supply Yard was being demolished. Lot 396, an isolated pocket of brown silty clay loam, was also deposited at the bottom of this cut. After Lot 362 and Lot 396 were deposited, the cut was filled with a brown inorganic clay loam coarsely mixed with very dark grayish brown organic soil and rocks (Plates 37 - 38). The purpose of this cut and fill is unknown. Within Lot 374/381, a small deposit of black homogenous gritty coal ash (Lot 377) was identified.

Within the area of the carpenter shop, a brownish yellow sand deposit (Lot 372) coarsely mixed with clay was found overlying Lot 359 in unit 706N-284E. To the south, Lots 348 and 349 were both identified above Lot 344, a black silty loam layer that overlay Lot 347 in unit 700N-284E. Lot 348 was a very dark grayish brown layer mixed with pebbly sand, silt, and chert and limestone gravel. Lot 349 consisted of a dark yellowish brown sand. Lot 344 might be related to the demolition process of the Ordnance and Supply Yard while the nature of Lots 348 and 349 could not be ascertained. They could relate to the Gardiner Expressway construction.

The Gardiner Expressway cut delineated the southern boundary of the excavation trenches. This medium brown sand deposit with gravel and cobbles was previously identified during the Stage 2 excavation and labelled as Lot 92 (ASI and Strata Consulting 2010:25). Only two deposits overlying the Gardiner cut were excavated and screened - Lot 356, a very dark grayish brown mixed deposit of gravel, sand, and silty clay loam mixed with concrete fragments and angular, coarse pebbles, and Lot 397, a mixed organic and non-organic deposit with gravel and sand.

Figure 19: Lots 314, 315, 340, and 342; utility pole base.

Figure 20: Lots 419 and 420; indeterminate post installed after 1936.

In the northeast corner of the excavation, Lot 442 was identified as a compact deposit consisting of brown non-organic soil mixed with slag, wood, and brick. It overlay Lot 389 in units 703N-271E, 704N-271E, 705N-270E, and 705N-271E. Lot 443 overlay Lot 442 and was a brown sandy clay layer lensd with slag, angular pebbles, and wood. Lot 444 also overlay Lot 442 and was an organic layer of greasy black loamy sand with ash. The stratigraphic position of these deposits of industrial waste indicates that they were spread after the abandonment of the Ordnance and Supply Yard. Finally, Lot 441, a small brown clay stain in unit 702N-271E, was interpreted as a post-1936 feature.

The final series of lots relates to the parking lot fills and demolition strata that were removed by the backhoe and were only observed in the profile. The most ubiquitous of these were Lots 1, 2, 3, and 30. Lot 2 was a grayish brown sand and gravel layer that lay directly beneath the asphalt parking lot. Lot 3, a coarse gravel with very pale brown sand layer directly below it was a preparatory surface for Lot 2 and the parking lot bed. Lot 1 was a dark brown pebbly clay loam with sub-angular and rounded pebbles that lay beneath Lot 3 and was the leveling fill for the parking lot. Lot 30 was a dark grayish brown pebbly loamy sand that was probably deposited as fill during the Gardiner Expressway construction in 1960. In many instances it lay directly above Lot 321.

More localized deposits of fill included Lot 302, a layer of flat shale pebbles; Lot 305, a dark gritty sand layer with water worn pebbles; Lot 307, a dark grayish brown silty clay layer; Lot 308, a metal lid found within the debris above the military store; and Lot 310, a brown sand. All of these layers were located above the older section of the Ordnance and Supply Yard and thus are representative of the deposits and demolition associated with the main section of the compound and the subsequent utilization of it during the Gardiner Expressway construction and, later, as a parking lot. Other localized deposits were located in the newer section of the enclosure. These included Lot 333, a brown sandy clay loam lens coarsely mixed with angular pebbles; Lot 378, a very dark gray pebbly loamy sand layer; Lot 380, a dark yellowish brown deposit of mixed fill; and Lot 388, a non-organic loamy sand. Together, these small lots represent localized post-1960s deposits within the area that became Fort York's parking lot.

5.0 ARTIFACT DISTRIBUTION

In total, 35,284 artifacts were recovered during the Stage 4 mitigative excavation of the Visitors' Centre location at the Fort York National Historic site (AjGu-26). A modified "Classification System for Historical Collections" (Canadian Parks Service 1992) was used to organize the data during analysis. The category of "Organic" was added to account for the modified faunal bone and shell commonly found in archaeological contexts. The following will summarize the contexts in which the artifacts were found and the distribution of the artifacts within large soil horizons.

5.1 Pre-Ordnance and Supply Yard

The lots that represent the natural stratigraphic sequence prior to the construction of the Ordnance and Supply Yard contained 17,205 historical artifacts and 11 pre-contact lithics (Table 5), representing 48.8 percent of the total assemblage. Not surprisingly, the largest lots covering the widest areas produced the most artifacts – the A-horizon Lot 321 (n=10,431), and the upper B-horizon Lot 322 (n=5,524). The A-horizon includes deposits that pre-date construction of the yard, as well as artifacts reflective of its ongoing use up until 1932.

5.2 Circa 1868 Configuration of the Ordnance and Supply Yard

The lots associated with the military store (Lots 309, 317, and 318), which represent the west section of the earliest configuration of the Ordnance and Supply Yard contained the fewest artifacts (n=106) of any other component. They represent 0.3 percent of the total assemblage. This is not surprising given that the footprint of the Visitors' Centre was designed to avoid most of the significant deposits in the Ordnance and Supply Yard that were documented during the Stage 2 assessment.

5.3 1910s-1936 Expansion of the Ordnance and Supply Yard

The lots that encompass the expansion of First World War expansion of the Ordnance and Supply Yard comprise a large component of the Stage 4 excavation for the Fort York Visitors' Centre. As previously discussed, this component mostly consisted of post moulds that delineated structures and spreads of soil that resulted from the activity areas within those structures. In total, 47 lots in this area produced artifacts and a total of 6,829 artifacts was recovered representing 19.3 percent of the total artifact assemblage (Table 7).

5.4 Exterior of the Ordnance and Supply Yard

The exterior of the Ordnance and Supply Yard produced 2,630 artifacts and thus comprise 7.5 percent of the artifact assemblage. Five lots produced artifacts with Lots 389 and 390 having the largest assemblages. These are summarized in Table 8.

| | Table 8: Class Totals by Provenience, Exterior Lots | | | | | | | | | | | |

5.5 Post-1936 Deposits

The post-1936 period is best represented by Lot 301 (n=3,967), a post-demolition topsoil, and Lot 362 (n=2,704), the layer associated with the demolished carpenter shop. In total, 8,503 artifacts were recovered from this component comprising 24.1 percent of the total assemblage.

6.0 ARTIFACT INVENTORY – PRE-ORDNANCE AND SUPPLY YARD

6.1 Lots 316 and 322

The B-horizon lots of Lot 316 and 322 contained 5,934 artifacts (n=410 and n=5,524 respectively). These are summarized in Table 10 below.

6.1.1 Lot 316 and 322 Architectural Class

Architectural class items comprise 14.6 percent of Lot 316 and 16.3 percent of Lot 322 (n=60 and n=899 respectively). Lot 316 contained 40 machine cut nails that date to between 1830 and 1900, five wire nails that postdate 1900s, 10 indeterminate nails, and five window glass fragments. Lot 322 contained one coarse red earthenware drainage pipe sherd, one hinge, 142 hand-wrought nails that predate 1830, 141 machine cut nails, 284 wire nails, 54 indeterminate nails, and 276 window glass fragments (Table 10; Kenyon 1982).

It is interesting to note that Lot 316 does contain wire nails, which suggests that the Lot 43 pavement was not added to the Ordnance and Supply Yard until the turn of the century, or that the twentieth-century artifacts were introduced along with the Lot 306 accretion to Lot 43.

6.1.2 Lot 322 Furnishing Class

Twenty-one furnishing class artifacts were recovered from Lot 322. They comprise 0.2 percent of this Bhorizon's assemblage and consist of 12 glass lamp chimney fragments, two pieces of furniture hardware (one handle and one fastener), six stoneware flower pot sherds, and one ornate cap for a flag stand or furniture (Table 10). Glass oil lamps were common in Canada in the later years of the nineteenth century as the dropping price of kerosene made them more affordable (Woodhead et al. 1984).

| Artifact Class | Lot 316 | Class Total as | Lot 322 | Class Total as | Total |

Table 10: Artifact Totals by Functional Class and Provenience from Lot 316 and 322

6.1.3 Lot 316 and 322 Kitchen/Food-related Class

The Lot 316 and 322 assemblage contains 2,419 kitchen and food-related artifacts (178 from Lot 316 and 2,241 from Lot 322) comprising 43.4 percent of Lot 316 assemblage and 40.6 percent of Lot 322 assemblage (Table 10). These artifacts relate to the storage, preparation, distribution, and consumption of food and beverages.

6.1.3.1 Lot 316 and 322 Ceramics

Ceramics are a useful tool for dating archaeological sites because of the historical progression of types in industrial-era ceramic production. Much of the innovation that took place in the eighteenth-century English ceramic industry resulted from the competition with the imported porcelain market from continental Europe and China (Kaellgren 2009:13). Thus in the 1740s, the English potters began experimenting with a new type of ceramic, creamware, a lightweight, refined cream-coloured earthenware. It was produced as early as 1740 by Enoch Booth but was perfected by Josiah Wedgwood in 1762 and quickly became attractive and popular as a status ware (Copeland 1995:4-6). The creamware glaze lightened in colour during the early nineteenth century with significant technological leaps in the ceramic making process (Majewski and O'Brien 1987:117). Creamware was imported into Ontario until circa 1830, mostly in the form of toilet and hygiene vessels and not table or teawares by this late date (Kenyon 1995).

Given the influx of creamware on the market, it quickly became an "old-fashioned" ware and to stay competitive pearlware was invented as an alternative to creamware in the mid-1770s. It tried to imitate Chinese porcelain by adding a small amount of cobalt oxide to the glaze and creating a slightly bluish tint (Miller and Hunter 2001). Pearlware ceramics were better suited for cobalt blue decorations which allowed pearlware to slowly grow in popularity (Majewski and O'Brien 1987:118). Pearlware vessels started to outnumber creamware by the early 1800s and continued to be sold in Ontario until the mid-1830s, when they were replaced with refined white earthenware (Kenyon 1995). Another popular early nineteenth-century ceramic type is Jackfield. Jackfield ceramics, refined red earthenware vessel forms with a glossy black glaze, were also popular in tea services during this time (Jouppien 1980:27).

In competition with the local English bone china market, refined white earthenware was slowly developed from pearlware by reducing cobalt from the glaze and adding it to the body and thus effectively making the ceramic white in colour (Majewski and O'Brien 1987:119). It grew in popularity due to the fact that many different underglaze colours looked better on a white-bodied ceramic than they did on the light-blue pearlware (Collard 1984:114). Thus, almost always decorated, refined white earthenware quickly became the most popular ceramic of the mid-nineteenth century (Majewski and O'Brien 1987:120).

Later, ironstone, or white granite as it was also known, started being produced in England in the 1840s as a heavier, cheaper alternative to the influx of hard paste porcelains from France into the markets of Canada and the United States (Majewski and O'Brien 1987:120). Due to its very hard durable body it became ubiquitous in frontier households. It started appearing in Ontario merchants' records in 1847 and grew in popularity steadily during the late nineteenth century, peaking in the 1880s (Kenyon 1995:10). While ironstone was the dominant ceramic in the second half of the nineteenth century, both it and refined white earthenware were still produced into the early twentieth century (Majewski and O'Brien 1987).

To take its place, semi-porcelain, a lighter, thinner variety of porcellaneous ceramic exhibiting more delicate floral or abstract motifs, grew in popularity. It was introduced in the 1880s and gained popularity

through the last decade of the nineteenth century (Kenyon 1995:13). The price of early semi-porcelain made it prohibitively expensive, but, as the price continued to drop at the turn of the century, it become a common household item by the 1910s (Kenyon 1995:13; Majewski and O'Brien 1987:124).

Another late nineteenth-century ceramic type was yellow ware. Yellow ware was primarily produced by American manufacturers in the northern states due to the predominance of buff coloured clay and the influx of English potters into North America (Gallo 1985:17). Yellow ware started appearing in merchants records in Ontario around the same time as ironstone and was used primarily as kitchenware (Kenyon 1995). Some variants of it are still used today though its production tapered off in the United States by the 1930s (Leibowitz 1985:9).

Less chronologically diagnostic ceramics consist of stoneware, coarse red and buff earthenwares. Red and buff earthenwares are heavy, thickly potted ceramic types that receive their names from the colour of the clay after firing – red and buff respectively. As they are porous, they had to be glazed to make them food safe. Usually coarse earthenware pots were produced at local potteries in contrast to the refined ceramic types that were imported into Canada. The local Ontario manufacturing of coarse earthenwares began as early as the late 1820s when German-speaking potters immigrated into the areas of Waterloo County and the Niagara Peninsula (Newlands 1979:22).

Porcelains are also not always chronologically diagnostic. Even though porcelain was manufactured as early as the seventh century AD in China, it was not exported to Europe in significant quantities until after the fifteenth century and the English colonies until the eighteenth (Majewski and O'Brien 1987:125-126). Europeans were only able to recreate china in the eighteenth century, with the first commercially viable version being bone china first marketed in England by Josiah Spode during the 1790s (Majewski and O'Brien 1987:126).

The ceramic assemblage of Lot 316 contains 175 sherds that consist of two pearlware sherds (1.1 percent), 149 refined white earthenware sherds (85.1 percent), 18 ironstone sherds (10.3 percent), one yellow ware sherd, one semi-porcelain sherd, one coarse red earthenware sherd, and three unidentifiable sherds (1.7 percent). There are 1,923 ceramic sherds in Lot 322 that consist of three creamware sherds (0.2 percent), 186 pearlware sherds (9.7 percent), 1,328 refined white earthenware sherds (69.1 percent), 61 ironstone sherds (3.2 percent), 35 yellow ware sherds (1.8 percent), 35 semi-porcelain sherds (1.8 percent), 54 red earthenware sherds (2.8 percent), 20 buff earthenware sherds (1.0 percent), 24 stoneware sherds (1.2 percent), and 177 unidentifiable sherds (9.2 percent).

The identification of decorative styles on refined earthenware ceramics can further refine the date assigned to an assemblage given that decorative styles change quickly over time. A summary of these styles, as well as the date range for their availability, is presented in Table 11. Based on this table and the percentage of wares discussed above, most of the ceramic assemblage from these lots does not postdate 1880. As was previously observed with the architectural class items, Lot 316 was probably capped by Lot 43 around the turn of the century or had intrusive objects introduced into its matrix at a later date.

Table 11: Refined Ceramic Decorative Styles in Lots 316 and 322 and Approximate Date Ranges in Ontario

| Style | Date Range | No. sherds Lot 316 | % of decorated ceramics | No. sherds Lot 322 | % of decorated ceramics |

Table 11: Refined Ceramic Decorative Styles in Lots 316 and 322 and Approximate Date Ranges in Ontario

Turning to a discussion of vessel uses, Lot 316 contains one kitchenware sherd, 173 tableware sherds, and one teaware sherd. Lot 322 contains 93 kitchenware sherds (4.8 percent), 1,764 tableware sherds (91.7 percent), and 66 teaware sherds (3.4 percent) (Table 10). The ceramics have also been sorted into a minimum number of vessels based on diagnostic rims, ware type, and distinctive decorative attributes. Coarse vessels were identified based on unique rim styles and/or overall shape. Lot 316 produced one identifiable vessel – an undecorated refined white earthenware bowl (Cat. #2713). Twenty-eight unique vessels were identified in Lot 322. These consist of six teacups, 12 saucers, three muffin plates, five supper plates, one table plate, and one meat dish (Tables 12 and 13).

|---|----|
|---|----|

6.1.3.2 Lot 316 and 322 Non-Ceramic Kitchen and Food Artifacts

Lot 316 contains three glass liquor container fragments among its non-ceramic kitchen/food class assemblage.

Lot 322 consists of 308 glass liquor container fragments, four glass fragments from milk containers, five utensils, one complete stopper, and one colourless glass tumbler base fragment (Table 10). Two of the milk container fragments display cap seat finishes that were popular in the late-nineteenth and early twentieth century (Jones and Sullivan 1985:79). The utensils consist of two bone handles, one antler handle, one table knife, and one spoon.

6.1.4 Lot 316 and 322 Organic Class

A third of the assemblage from both Lot 316 and Lot 322 consists of highly fragmented faunal material, much of which has been thermally altered. Lot 316 (n=176) contains two avian bones, 72 mammal bones, one shell, and 62 bones that are burned. Lot 322 (n=1,745) consists of one avian bone, 1,123 mammal bones, 23 shell fragments, six fish fragments, 584 burned bone fragments, and eight unidentifiable bone fragments (Table 10).

6.1.5 Lot 316 and 322 Personal Class

The personal class from Lot 316 (n=24) consists solely of smoking pipe fragments (Table 10). One of the stem fragments displays a Murray-Glasgow maker's mark that indicates that it was produced between 1833 and 1861 (Kenyon 1984).

The Lot 322 personal class assemblage consists of one adornment item, 14 clothing items, one medicine item, 172 personal gear items, and 15 toilet/hygiene artifacts (Table 10). The adornment item is a multi-facetted (hexagonal) glass bead (Plate 45); the clothing items consist of 13 buttons and one collar stud; the medicine sub-class consists of one container glass fragment; the personal gear consists of one coin, one lion head-shaped military badge (Plate 46), one epaulette, 168 smoking pipe fragments, and one very corroded token; and the toilet and hygiene artifacts consist of 14 chamber pot sherds and one ironstone toothbrush box sherd.

Collar studs came about due to the development of the detachable turned-down shirt collar in the late nineteenth century. Studs were first patented in 1872 and were used to fasten the stiff collars to the body of the shirt (Eckstein et al. 2000:15).

Ten chamber pot sherds are pearlware and four are yellow ware. The medicine container is represented by a colourless glass finish with a flanged lip. This type of finish was popular on medicine vials throughout the nineteenth century (Jones and Sullivan 1985).

The epaulette consists of moulded metal letters "2DBCO/CANADA," which stand for "2nd Depot Battalion 1st Central Ontario Regiment" (Plate 47). Depot Battalions were established in 1917 and 1918 to obtain personal to be sent to the Canadian Reserve Battalions in England when it was no longer possible to recruit enough men for the infantry regiments (Library and Archives Canada 2012a:1). The 2nd Depot Battalion 1st Central Ontario Regiment was authorized by General Order 118 of December 1, 1917 and by General Order 57 of April 15, 1918 (Library and Archives Canada 2012a:24).

Out of the 168 smoking pipe fragments, 97 are bowl fragments and 71 are stem fragments. One of the pipes has an almost complete bowl with a partial stem. The bowl is decorated with the regal coat of arms with a lion on one side and a unicorn on the other (Plate 48). Five stem fragments contain identifiable maker's marks. These are summarized in Table 14 below.

| | Table 14: Identifiable Pipe Maker's Marks from Lot 322 | | | | | |
|-------------|---|--------------------|-------------|--|--|--|
| Cat. # | Provenience | Maker's Mark | Date* | | | |

| * All dates | * All dates are derived from Walker 1971 and Kenyon 1984. | | | | | |

The 13 buttons consist of one bone, two metal, six shell, and four ceramic specimens. Bone buttons were mostly utilitarian in nature and used primarily on men's underwear. They were some of the earliest buttons produced beginning in the eighteenth century, and they started to fall out of popularity by the 1850s. After the 1850s, bone buttons were produced in fewer numbers until they disappeared in the beginning of the twentieth century (Ferris 1986:100). The 17 mm diameter bone button from Lot 322 is four-holed and has been stained brown. Its size and style suggests that it was probably used for outerwear (Plate 49).

Metal buttons were also commercially manufactured beginning in the eighteenth century. Most metal buttons fell out of fashion by the 1830s but metal continued to be used on military and utilitarian clothing throughout the nineteenth century (Ferris 1986:98). One of the metal buttons from Lot 322 is a plain flat disc that is 13 mm in diameter with a shank broken off. Another is an 18 mm brass tunic button that displays a crown relief in the centre encircled by the words "CANADA MILITIA," and a leaf motif around the edge (Plate 50). This decorative style has been dated to between 1870 to the early 1900s (Bradley 1991:12).

Shell buttons became popular after 1820 and by the 1860s could be made cheaply enough for local entrepreneurs to establish factories. They were worn mostly on shirts and blouses with larger specimens used for waistcoats, frocks, and full-length coats (Ferris 1986:100). Four of the shell buttons are four-hole sew-through buttons that are between nine and 11 mm in diameter. Two shell buttons are two-hole sew-through buttons that are 12 mm in diameter. These buttons would have been used on shirts or underwear.

Hand-made porcelain buttons have been used since the eighteenth century but it was not until Richard Prosser patented the machinery in 1840 that ceramic buttons became widely available (Epstein and Safro 2001:74; Sprague 2002:111). Their manufacture quickly spread to France and the United States in the 1850s and they became extremely affordable. These machine-made prosser buttons were fashionable and readily available between 1850 and 1920 (Luscomb 1967:156) and were used primarily on men's shirts, women's dresses, and children's clothing (Ferris 1986:100). These buttons fell out of manufacture around the 1950s (Sprague 2002). Three out of the four prosser buttons are four-holed and 11 mm in diameter (Plate 51). These were probably used as shirt buttons. The other prosser button is an incomplete domed shaped button that is 13 mm in diameter. Such dome shaped buttons were popular on gaiters (Sprague 2002:112).

The corroded copper metal coin that was recovered from Lot 322 is 27.4 mm in diameter and weighs 5.7 grams (Plates 52 - 53). The accretions on the coin are dense and obscure any designs or text that may be present on its surface. It was therefore subject to X-radiography (X-ray) to aid in the identification of the coin. In some circumstances, when an object is mineralised or corroded, radiography can provide information on form and structure, manufacture technology and surface features in addition to the condition of the artifact (Carnevale et al. 2012).

The X-ray shows that the coin is a cast piece with the pressed letters "CD" or an under-formed "GD" in its centre. Underlying the letters and perpendicular to them is the faint raised design of the image of Britannia seated facing left on a shield with the left arm stretched upward holding a spear in the centre of the coin. The letters "BRITAN" (on the left) and "NIA" (on the right) are present around the perimeter (Plate 53). No date is observable on the coin. Raised text appears on the reverse side around the perimeter of the coin that reads "GEORGIVS · III · REX ·" and a bust of King George III, facing right, appears in the centre of the coin (Plate 53).

The coin is particularly interesting for a number of reasons. The first is the discrepancy in the diameter and weight of the coin. The copper George III halfpenny was minted from 1770 through 1775. Its diameter ranged from 28 to 31 mm and its weight from 9.2 to 10.8 grams. The obverse of the halfpenny shows a right-facing bust of the king, with the inscription "GEORGIVS III REX" while the reverse shows a left-facing seated Britannia holding a spray and spear, with the inscription "BRITANNIA" and the date in the exergue beneath Britannia (Smith 1996). The farthing was minted in 1771 and from 1773 through 1775. Its diameter ranged from 23 to 24 mm and its weight from 4.3 to 6.6 grams. The obverse of the farthing shows a right-facing bust of the king, with the inscription "GEORGIVS III REX" while the reverse shows a left-facing seated Britannia holding a spray and spear, with the inscription "GEORGIVS III REX" while the reverse shows a right-facing bust of the king, with the inscription "GEORGIVS III REX" while the reverse of the farthing shows a right-facing bust of the king, with the inscription "GEORGIVS III REX" while the reverse shows a left-facing seated Britannia holding a spray and spear, with the inscription

"BRITANNIA" and the date in the exergue beneath Britannia (Smith 1996). The coin recovered from Lot 322 has the weight of a farthing but the size of a halfpenny.

In their book, *The Forgotten Coins of North America*, William Anton and Bruce Kesse (1992) state that counterfeiting of copper coins was rampant during the reigns of King George II (1727-1760) and George III (1760–1820) in Britain and America. They discuss the 1975 Philadelphia highway find of a cache of 362 cast counterfeit William III halfpence discovered during the construction of Interstate 95, the cache being the earliest surviving group of counterfeit British halfpence in the American colonies (Newman, and Gaspar 1978; Anton and Kesse 1992). In 1771, Britain made it a felony to produce counterfeit copper coins. However, British counterfeiters looked to America as a new market and as early as 1785/1786 some varieties of counterfeit halfpence were produced in Britain solely for export to America (Newman and Doty 1976; Newman 1988; Anton and Kesse 1992). The most common counterfeit copper coins in Britain and America were the George II and George III halfpennies and to a lesser extent the farthing (Smith 1996). It wasn't until the 1820s that counterfeit copper coins were no longer in circulation in America due to the large number of official large cents and half cents being struck by the U.S. mint (Smith 1996).

The presence of the impressed "CD" or "GD" struck over the original design represents a counter-mark and later alteration to the coin. Counter-marking coins was a common practice until the 1900s (Anton and Kesse 1992; Cook 2006). Counter-marks in the eighteenth and nineteenth century on coins were used in a variety of ways. For example, they were used to reference a location, like the Caribbean countermarks of the 1700s ("T" for Trinidad or "D" for Domingo) and the 1830s to 1850s Central America Republic counter-stamp; as advertising marks, such as a New York theater's address incised onto the face of 1794 Spanish-Colonial reales; "silversmith stamps" on worn copper coins around the 1820-1840s period; and as an institution or an individual's mark (Anton and Kesse 1992; Cook 2006). Given its presence at Fort York, it is possible that the "CD" or "GD" counter-mark represents the initials of one of the regiments stationed at the fort, or who passed through Toronto, possibly "Coleman's Dragoons," aka the "Canadian Dragoons" or "Coleman's Troop," or the "Green Dragoons," the nickname given to the 13th Hussars who were garrisoned at Toronto in the 1860s (Spittal 2000). Coleman's Dragoons was a small British provincial militia cavalry troop raised by Captain Thomas Coleman in Montreal in early 1813. They saw action on the Niagara frontier later that spring before being redeployed to Amherstburg and escaping the British defeat at Moraviantown on October 5, 1813. They remained on active patrol duty along the Thames River frontier until the end of the war (Chris Laverton, personal communication 2012). The font used on the coin is a Straight Serif, which is a font commonly used on military buttons such as 11th Light Dragoons (Caplan 2004).

It is therefore likely that the coin recovered from this lot represents a counterfeit coin that dates to between 1770 and the 1820s, unlike the authentic coins of this type that are dated and marked 1770 to 1775. This coin was then counter-marked with the possible initials of a military regiment present at Fort York.

6.1.6 Lot 316 and 322 Tools and Equipment Class

The Lot 316 tools and equipment class assemblage consists of three spikes and one staple. Lot 322 tools and equipment items consist of 141 artifacts. Out of these artifacts, there are two animal husbandry related artifacts, 25 armament class artifacts, 31 general tools, 63 hardware items, three porcelain insulators, one recreation item, three sewing items, 11 specialized tools, and two writing artifacts (Table 10).

The animal husbandry artifacts consist of two horse harness buckles. Hardware items consist of six bolts, two chain links, one clasp, two connector fragments, one fence picket, four large canvas grommets, one rod, eight screws, seven spikes, 11 spring fragments, eight pieces of strapping, one tack, one tent peg, nine wire fragments, and one unidentified hardware fragment. The sewing items consist of one needle and two straight pins. One slate pencil and one slate tablet fragment represent the writing sub-class. The recreation item is a clay marble (Plate 54). Clay marbles have been produced since antiquity and remained popular until the 1940s (Kenyon 1981).

The armament items are represented by one percussion cap, three hollow point lead minié balls, 11 shell casing fragments, one lead shot fragment, and nine pieces of barrel strapping. Percussion caps were cuprous caps filled with shock-sensitive explosive material and were required for firing caplock muskets. Caplocks muskets were introduced to Canada in 1838 and were an improvement from earlier flintlock muskets in that they did not misfire in wet weather. Caplock mechanisms remained popular on guns until the late nineteenth century (The Upper Canada Historical Arms Society 1992). The minié ball, named after its co-developer Claude-Étienne Minié, was invented in 1847 to allow a bullet to more effectively utilize a rifled barrel (Knight 1876:402). The .577 inch minié ball was quickly adopted and utilized during the Crimean War and the American Civil War with deadly effectiveness. The first .577 inch rifles came to Canada in 1853 and continued to be used until they were replaced by the weapons that fired .303 full metal jacket rounds in 1893 (The Upper Canada Historical Arms Society 1992:37).

The shell casing fragments represent seven individual shells. Of these, four are .303 shell casings and three are shotgun shells. The British .303 cartridge was developed in 1888 and consisted of a full metal jacket encasing a packet of powder and a bullet. Rifles that fired this round were first introduced to Canada in 1893 and became standard issue at the turn of the century (The Upper Canada Historical Arms Society 1992:37-39).

Cuprous barrel hoop fragments recovered from this context are bent and twisted out of shape (Plate 55). Some display clear evidence of thermal alteration. It is surmised that these fragments were introduced into Lot 322 as the result of the Grand Magazine explosion that took place on April 27, 1813 at the climactic end of the Battle of York (Benn 1993:56). Gunpowder would have been stored in the magazine in barrels constructed with copper hoops to prevent the metal from producing sparks accidentally. Similar twisted cuprous barrel hoop fragments have been found at Fort York (David Spittal, personal communication, 2011), but none were found during the test excavation of the southern ramparts to locate the crater left by the explosion of the Grand Magazine (ASI 2012c).

General tools consist of 20 stoneware blacking bottle sherds, three bucket fragments, and eight sherds from a nearly complete stoneware container. The stoneware container displays brown glaze on its exterior, a wedged foot ring, tapered body, and a groove below the rim to help tie down a cover (Plate 56). This may have contain shoe or stove polish. Specialized tools consist of 10 ruby red glass fragments for kerosene lanterns that would have been used around the turn of the twentieth century on horse drawn carriages and early cars (Plate 57), and one complete whistle (Plate 58).

Among the insulators, one is glass and the other two are a porcelain knob and a porcelain cleat. The first insulators were made of wood and were used extensively during the 1880s. Wood was ideal for carrying low power telegraph signals but proved problematic for greater charges as dry wood could catch fire and only perfectly dry wood could be used. To overcome the problems presented by wood, porcelain insulators were invented and came into prominence by the early 1890s. This ushered in an era of porcelain "knob and tube" wiring that lasted between 1890 and 1930. Knobs and cleats were used to run electrical wires along the walls while tubes were used to run wires through the walls (Myers 2010:33).

6.1.7 Lot 316 and 322 Indeterminate Class

Unidentifiable artifacts comprise 1.7 percent of the Lot 316 assemblage and 5.0 percent of the Lot 322 assemblage. These could not be assigned to a functional class. Lot 316 contains four unidentifiable container glass fragments and three miscellaneous unidentifiable items. Lot 322 contains 270 artifacts that consist of 185 unidentifiable container glass fragments, 19 pieces of ferrous scrap metal, three pieces of cuprous scrap, and 64 miscellaneous unidentifiable items (Table 10).

Out of the unidentifiable container glass fragments, one is a milk glass fragment and six are solarized glass fragments. The presence of these glass colours is important as they are chronologically diagnostic. Milk glass, also known as opaque white glass, has been produced since the early sixteenth century. However, it was not until the late nineteenth century did it become more widely used on tableware, containers, and lighting devices (Jones and Sullivan 1985:14). Solarized glass was colourless when produced. However, the manganese that was used to overcome the slight discolouration in glass turned a slight purplish tint after prolonged exposure to ultraviolent rays of the sun. This method of manufacture became common in the late nineteenth century and was popular until World War I (Jones and Sullivan 1985:13).

6.1.8 Lot 322 Pre-Contact Artifacts

Two pre-contact aboriginal lithic artifacts were recovered from the Stage 4 excavation for the Fort York Visitors' Centre. They consist of one piece of Bois Blanc shatter (Plate 59) and a secondary Onondaga knapping flake (Table 10).

6.2 Lot 321

Lot 321 is one of the most ubiquitous lots from the Fort York Visitors' Centre excavation. Artifacts from this context span the pre-contact occupation of the Garrison Common, through the War of 1812 period to the construction and use of the Ordnance and Supply Yard. Not surprisingly, this lot produced the largest amount of archaeological material. All 10,431 artifacts from this context are summarized in Table 15 below.

6.2.1 Lot 321 Architectural Class

Almost half of the artifacts from Lot 321 are architectural items (n=4,792). Among the nails, there are 140 hand-wrought nails, 398 machine-cut nails, 2,452 wire nails, and 178 indeterminate nails (Table 15). The nails confirm the varied nature of this deposit and the heavy twentieth-century use of the Ordnance and Supply Yard. The seven cuprous nails in Lot 321 further relate to the handling of flammable or explosive material (Table 15).

| Artifact Class | Total | | enience from Lot 321 Class Total as Percent of Lot 321 |
|----------------------------------|--------|-------|---|

| Lithic | 9 | / | 0.2 /0 |
| Artifact Total | 10,431 | | 100.0% |

Other architectural class material consists of one hinge, one latch hook, one lock, one mortar fragment, and 1,613 pieces of window glass (Table 15). The lock is a padlock that has the word "BUTT-IN" written on the front and the back.

6.2.2 Lot 321 Furnishing Class

The Lot 321 furnishing class contains 128 artifacts (Table 15). These are discussed by subclass in separate sections below.

6.2.2.1 Lot 321 Furniture

There are two artifacts in the furniture subclass – a pair of cuprous furniture leg tacks.

6.2.2.2 Lot 321 Household Accessories

There are 16 artifacts among the household accessories subclass. These consist of two baluster fragments from a railing or fence, 10 terracotta flower pot sherds, and four key fragments.

6.2.2.3 Lot 321 Lighting Devices

There are 108 artifacts in the lighting devices subclass. These consist of two glass fuses, one glass lamp chimney fragment, 103 incandescent light bulb fragments, one light switch (Plate 60), and one sconce fragment. The porcelain light switch fragment is for a ceiling mounted switch. One of the glass fuses has the embossed text "V125."

6.2.2.4 Lot 321 Miscellaneous Furnishings

Two miscellaneous furnishing objects consist of a leather book clasp and a commemorative plaque. The plaque consists of a thin rectangular plate with a small perforation in each corner. On it in impressed capital letters it reads "PRESENTED BY THE / PHILATHEA CLUB / CHRIST P. B. CHURCH / TORONTO." It was recovered from unit 702N-296E. The date for this plaque could not be discerned.

6.2.3 Lot 321 Kitchen/Food-related Class

The Lot 321 assemblage contains 1,792 kitchen and food-related artifacts comprising 17.2 percent of this lot's assemblage (Table 15).

6.2.3.1 Lot 321 Ceramics

The importance of ceramics to dating Euro-Canadian sites was discussed above in Section 6.1.3.1 and shall not be repeated here. There are 1,530 sherds in Lot 321. These consist of 61 pearlware sherds (4.0 percent), 1,021 refined white earthenware sherds (66.7 percent), 29 ironstone sherds (1.9 percent), 57 yellow ware sherds (3.7 percent), 30 semi-porcelain sherds (1.9 percent), 226 coarse red earthenware sherds (14.8 percent), three refined red earthenware sherds (0.2 percent), 11 buff earthenware sherds (0.8 percent), 20 stoneware sherds (1.3 percent), and 72 unidentifiable sherds (4.7 percent). A summary of decorative motifs from Lot 321 is provided in Table 16.

| Transfer print, teal | 1880s | 2 | 0.4% | | | | |
| Decalcomania | 1880-present | 1 | 0.2% | | | | |
| Total | | 557 | 100.0% | | | | |

The ceramics from Lot 321 date mostly to the mid-nineteenth century with some artifacts representing the early nineteenth and early twentieth centuries. This contrasts with what has been observed previously with the architectural material that dates predominantly to the early twentieth century. This suggests that the deposition of kitchen/food refuse declined significantly after the construction of the Ordnance and Supply Yard and declined further with its expansion in the First World War era. This is similar to the other A-horizon lots, Lot 354 and Lot 390, where ceramics give an earlier date than other chronologically diagnostic artifacts.

In terms of vessel uses, Lot 321 contains 229 kitchenware sherds, 1,272 tableware sherds, and 29 teaware sherds. Seventeen unique vessels have been identified in this lot and consist of nine teacups, four saucers, one milk pan, one jar, one bowl, and one supper plate (Tables 17 - 19).

6.2.3.2 Lot 321 Non-Ceramic Kitchen and Food Artifacts

There are 262 kitchen and food artifacts that are not ceramic (Table 15). These consist of one bottle cap, one bottle opener, 214 glass liquor container fragments, 16 glass milk container fragments, eight glass mineral water container fragments, four glass soft drink container fragments, one cork, two aqua glass stoppers, 10 colourless glass tumbler fragments, and five utensils.

One of the glass milk containers displays the name "CITY DAIRY Co" which refers to the City Dairy company that operated 1900 and 1942 (Phillips 1989:148).

The bottle cap is threaded for use on a food or condiment container. Utensils consist of one table knife, one table spoon, one tea spoon, one indeterminate wooden handle, and one rubber and metal handle, possibly from a table knife. It is important to note that one of the tea spoons is pewter and therefore dates to the early nineteenth century (Kenyon 1983).

6.2.4 Lot 321 Organic Class

Just under 15 percent of the Lot 321 assemblage consists of faunal material. Out of the 1,538 specimens that comprise this group, nine are avian bones, 10 are fish bones, 1,383 are mammal bones, 12 are shells, 118 are burned bones, and six are unidentified bones (Table 15).

6.2.5 Lot 321 Personal Class

There are 318 artifacts in the personal class of Lot 321. These consist of 42 clothing items, one medicinerelated artifact, 214 personal gear items, and 61 toilet/hygiene items (Table 15). These are elaborated in their subsections below.

6.2.5.1 Lot 321 Clothing Items

A total of 42 artifacts belong to the clothing sub-class in Lot 321. These consist of three leather belt fragments, three rectangular belt buckles, 24 button fragments, nine leather shoe fragments, one grommet, and two cuprous suspender clips.

The button fragments represent 21 buttons. These consist of two bone buttons, 12 metal buttons, one shell button, five ceramic buttons, and one glass button. The bone buttons are all four-hole sew through specimens that are 12 mm and 18 mm in diameter. The former was probably used on a shirt while the latter is large enough for underwear or outerwear.

The metal buttons consist of a variety of button types. Three buttons are four-hole sew-through types with a concave centre. They measure 14 mm, 16 mm, and 17 mm in diameter. These were most likely used on suspenders but could have also been used on work shirts or trousers. Two buttons are domed, single piece specimens with broken shanks. They are 10 mm and 11 mm in diameter and were probably used on cuffs. Another metal cuff button is 12 mm in diameter and contained a glass, bone, or shell inlay that is now missing.

Two heavily corroded metal buttons are pewter. One of these is 19 mm in diameter (Plate 63) while the other is 21 mm. Both of these are missing their shank but likely had a loop back eye. The accretions on the buttons were dense and obscured any designs or text that may be present on their surface. The larger specimen (Cat. #13545) was therefore subject to Neutron radiography (N-ray) and X-radiography (X-ray) in order to aid in the identification of the button.

Before the images were taken, a metal scratch test was conducted in order to determine if the front surface of the button was brass, silver or pewter. The grey-blue appearance of the metal confirmed the button was not brass but likely silver or pewter as pewter becomes grey-blue in colour as it oxides and loses its silver tint. The easy malleability of the material by hand further makes the button more likely to be pewter. This was confirmed using non-destructive portable X-ray Fluorescence (pXRF) analyses. The results showed a high tin content (~65.32%), lead content (~25.42%) and antimony content (~5.0%) which are typical for the composition of third grade pewter used to produce non-food or drink related items such as buttons. No copper was measured on the surface and the remaining elements represent impurities.

The N-ray and X-ray show that the button is a cast, two piece button that has been flattened with the front made from pewter and the back from copper. Due to the heavy corrosion of the piece, and the fact that the pewter surface is very thin, it was not possible to identify any design on either surface (Plate 64).

It is important to note, however, that pewter was a popular material for buttons since the eighteenth century. Originally, the shanks for the pewter buttons were cast along with the piece but the soft, lead-based material quickly wore out while in contact with the thread. This changed in the early 1800s when a more durable shank was attached separately from the pewter button, as in the case of the two specimens from Lot 321. Such flat pewter buttons with separate shanks were popular until the 1830s when the use of pewter buttons either disappeared or continued with an applied brass rim for sturdiness (Marsh 2009). Flat pewter buttons are notable in this context as they were the chief button type used on outerwear on American military uniforms during the War of 1812 (Pfeiffer and Williamson 1991:72-73). However, such buttons were also common on civilian clothing.

The last four metal buttons from Lot 321 were more socially and chronologically diagnostic. One of them is a 13 mm in diameter florentine button. Florentine buttons are metal cloth-covered buttons with a flexible cloth shank. They were first patented in 1825 and became the dominant button type in the 1850s with the decline in popularity of metal buttons and the Victorian taste for simplicity and plainness (Ferris 1986:98). This specimen might have been used on a vest. By the 1880s, a second type of cloth-covered button appeared. These were utilitarian two-piece, two-hole sew-through buttons made of a copper alloy and covered with fabric to match clothing (Lindbergh 1999:52-53). One such button is found among the Lot 321 assemblage and it is 18 mm in diameter. Another button from this group is a snap button that is 12 mm in diameter and has an incised diamond with corroded lettering. Snap buttons are a late nineteenth-century invention that became popularized in the twentieth century. The last metal button is a corroded and fragmentary Canadian military button. It displays a crown and a leaf in relief with the words "Honi soit qui mal y pense" inscribed around the circumference. This was a general service button used by the Canadian military during the First World War.

The shell button is a four-holed sew-through specimen measuring 10 mm in diameter. The ceramic buttons consist of five plain four-hole sew-through buttons that measure 11 mm in diameter. All were probably used on dress shirts.

One black glass button is 28 mm in diameter; the shank has been broken off, and it probably was used on a coat. Glass buttons were never produced in any significant quantity. They were introduced as early as the 1830s and used for cufflinks and occasionally on coats and elaborate dresses (Ferris 1986:102). Black glass buttons became the height of fashion in 1861 after the death of Prince Albert, the consort of Queen Victoria who went into deep mourning, thus making black clothing, buttons, and jewellery very popular. The popularity of glass buttons waxed and waned in the second half of the nineteenth century, peaking in the 1860s, early 1870s, early-to-mid 1880s, and again in the mid-1890s. Many glass buttons in this time period were popular on waistcoats (Lindbergh 1999:54-55).

The leather shoes consist of one heel fragment, one leather insole, six upper fragments, and one complete shoe. The complete shoe is 24.1 cm (9 $\frac{1}{2}$ inches) in length, 6.4 cm (2 $\frac{1}{2}$ inches) in width at the heel, and 8.3 cm (3 $\frac{1}{4}$ inches) in width at the ball (Plate 65). The stitching was handled by a Goodyear machine for sewing shoes. This method was created by Charles Goodyear in the 1870s and relies on a ridge on the insole to hold the welt and the outsole together (Stevens and Ordoñez 2005:13). The shoe appears to have also been pegged with iron pegs around the heel and the ball of the foot suggesting that it may have been intended to be used as work footwear.

T 1.1 00 1.1

6.2.5.2 Lot 321 Medicine

One medicine-related artifact was recovered from Lot 321, a glass container fragment with a flanged lip characteristic of vials (Jones and Sullivan 1985:79).

6.2.5.3 Lot 321 Personal Items

A total of 214 artifacts are in the personal items sub-class. These consist of one coin, one token, three maple leaf-shaped badge fragments, and 209 smoking pipe fragments.

Unfortunately, the identification part of each badge fragment is missing (Plate 48). The coin is a 1909 Canadian dime and the token is a corroded 1850 Canada token with one side having the inscribed words "BANK OF UPPER CANADA" while the reverse is inscribed with "BANK TOKEN/ONE HALF PENNY."

The smoking pipe fragments consist of 114 bowls and 95 stems. Five of the stem fragments have identifiable maker's marks. These are summarized in Table 20 below.

| | Table 20: Identifiable Pipe Maker's Marks from Lot 321 | | | | |
|-------------|--|------------------------------|-------------|--|--|
| Cat. # | Provenience | Maker's Mark | Date* | | |
| 13429 | 706N-297E | W. WHITE-GLASGOW | 1826 – 1899 | | |
| 13514 | 707N-296E | McDOUGALL-GLASGOW | 1846 – 1967 | | |
| 13514 | 707N-296E | HENDERSONS-MONTREAL | 1847 – 1876 | | |
| 13446 | 706N-298E | BANNERMAN-MONTREAL | 1857 – 1907 | | |
| 7865 | 701N-288E | W & D BELL | 1862 – 1877 | | |
| * All dates | s are derived from | Walker 1971 and Kenyon 1984. | | | |

6.2.5.4 Lot 321 Toilet/Hygiene Items

There are 61 artifacts in the Lot 321 toilet/hygiene subclass. These consist of two wooden brush fragments, 57 chamber pot sherds, and two celluloid comb fragments. Cellulose nitrate was first invented by Alexander Parkes in 1856. A less flammable version of this was invented in 1869 by John Welsey Hyatt and started to be used in large quantities for jewelry, toothbrushes, and buttons by 1900. Cellulose nitrate fell out of use due to the mass production of cellulose acetate, an "improved" type of celluloid that began to proliferate after the 1920s (King 1991:3-4; Springate 1997:63).

The chamber pot sherds are from a single yellow ware vessel with a horizontal blue mocha motif on a white field and surrounded by blue bands. Horizontally oriented mocha motifs became popular in the 1870s (Gallo 1985:43).

6.2.6 Lot 321 Tools and Equipment Class

A total of 584 artifacts from Lot 321 belong to the tools and equipment class (Table 15). These consist of 22 animal husbandry items, 57 armament items, 17 general tools, 436 hardware artifacts, three recreation

items, 13 specialized tools, one writing tool, and 35 miscellaneous tools and equipment objects. The subclasses are elaborated on further below.

6.2.6.1 Lot 321 Animal Husbandry Items

The 22 animal husbandry items consist of three harness buckles, two horseshoes, 15 horseshoe nails, and two leather horse harness tacks associated with one of the harness buckles.

6.2.6.2 Lot 321 Armament Artifacts

The 57 armament items consist of two bullets, two friction tubes (Plate 66), one friction tube pin, one ferrous grapeshot fragment, one gun part, three gunflints, one pistol cleaner, one small ramrod fragment, and 45 shell casing fragments.

The ramrod fragment would have been used for a muzzle-loading weapon like a pistol or a musket. However, it is very fragmentary and only half of the tip is present. The friction tube was invented in 1853 and was used to fire breach loading cannons into the First World War era (Gooding 1988:51).

The bullets consist of a lead .45 calibre bullet from a Westley Richards rifle (Plate 67) and one .303 with a pointed tip and weigh of 11.3 grams/ 174.4 grains (Plate 68). The Westley Richards rifle was patented in 1858 and was considered to be the best breech-loading rifle of the period. It was introduced to Canada in 1861 when it was issued to the Montreal brigade (The Upper Canada Historical Arms Society 1992:31-32). The 174 grain pointed bullet was adopted in 1910 as the Mark VII and it remained the standard bullet for the remainder of the .303 cartridge service life (Tebbutt 2001; Barnes 2012:386).

The gun part is a complete brass trigger guard (Cat.# 22367) for a Snider-Enfield rifle (Plate 69), which was issued by the British army in four basic models beginning in 1866; in particular, the long rifle was issued to the infantry while the short rifle was issued to rifle battalions (The Upper Canada Historical Arms Society 1992:33-34). The specimen recovered from Lot 321 could have fit onto either a short or long rifle (Len Collins, personal communication 2013). The gunflints recovered from this lot are all of British origin – one is a dark gray glossy colour and two are clear, light gray and translucent in colour. Both of these colours are diagnostic of the Brandon quarry in Suffolk County, northeast of London, England (Kelmotsu 1990:95).

The pistol cleaner is a long cuprous rod that is 18 cm (seven inches) long and 5.4 mm (.21 inch) wide with a rectangular "eye" on one end much like a darning needle. Cloth cleaning wads would be held in place by the eye and inserted into the pistol barrel (Plate 70). This could have been used on a Webley service revolver whose barrel was six inches long (Richard Gerrard, personal communication 2013). The Webley revolver was not a standard issue Canadian sidearm but was a popular choice for private purchase by officers in the Canadian Expeditionary Force. The Webley Mark VI Revolver was the final version that was adopted in 1915 (Canadian Soldiers 2013).

The shell casings consist of two pistol shells, three shotgun shells, 20.22 shells, and 20.303 shells (Plate 71). One of the pistol shells is a .32 rim-fire shell and the other is .36 shell, both were popular cavalry and officer side arms in the middle of the nineteenth century (The Upper Canada Arms Society 1992:20-21). One of the shotgun shells is stamped with the manufacturer's name "REMINGTON."

The .22 rim fire round does not have a lot of stopping power and was thus used for training. Between 1919 and 1939, all Canadian militia units were armed with the Lee-Enfield Mk. III. This rifle, along with the Lee-Enfield Mk. I was converted to .22 rim-fire for target training purposes. This practice was abandoned in September 1939 when all Canadian troops were armed with Lee-Enfield Short Rifles, Mk III that used the .303 cartridge (The Upper Canada Historical Arms Society 1992:42).

Four of the .303 shells are stamped with "DAC/C/IV." These Mark IV were only actively used around the turn of the century before being retired in 1903 for anything but training purposes (Tebbutt 2001).

Two of the .303 shells had their tips sawn off (Plate 72). The reason for this is unknown but it might have been to remove powder or cordite from the bullet. Finally, one .303 shell was not fired but instead had the tip broken and the bullet removed. The bullet still contained cordite. Cordite was one of the first widely utilized smokeless powders. They were first adopted in 1892 and continued to be employed in .303 cartridges until 1973. Cordite is made up of 58 percent nitroglycerine, 37 percent nitrocellulose, and five percent mineral jelly (Tebbutt 2001). Given its inherent flammability and instability, this material was recorded but not retained due to the health and safety concerns on behalf of the project team.

6.2.6.3 Lot 321 General Tools

Nine stoneware blacking bottle sherds, one file, one tong fragment, and six other miscellaneous tools comprise the general tool artifact subclass of Lot 321 (n=17).

6.2.6.4 Lot 321 Hardware Items

There are 436 hardware items in Lot 321. These consist of 79 bolts, one carbon rod, 20 chain links, two clasps, three cuprous tacks, one eye bolt, one fastener, one fire hydrant cap, 11 pieces of fitting, 42 large canvas grommets, one handle, one hook, six nuts, three rods, 122 screws, 29 spikes, three springs, three staples, nine strap loops, 32 pieces of strapping, three tacks, one tent peg, three washers, 49 wire fragments, and 10 miscellaneous hardware item. One of the miscellaneous hardware items is a machine-cut nail that has been heated, split, and modified into a two-pronged object for an unknown reason.

Four of the large canvas grommets contain the maker's mark "GARY & PRIER. LONDON." Unfortunately, the details about this maker could not be ascertained.

The carbon rod is 15.2 cm (six inches) long and 1.9 cm (¾ inch) in diameter. It has a band of copper straining on one end and appears to have been used for some sort of an electrical implement given that the earliest functioning dry cell battery operated with a carbon rod within a cylinder filled with manganese dioxide acting as the cathode (positive terminal) and the zinc rod outside the cylinder acting as an anode (negative terminal) (Museum of Technology 2013). Many more of these objects were recovered from Lot 393 and are discussed in Section 8.2.6 below.

6.2.6.5 Lot 321 Recreation Items

The recreation items consist of one doll fragment and two marbles. The doll fragment is a porcelain doll head that was meant to be attached to a body of cloth or soft leather (Plate 73). They were first made in France in the 1840s but their production intensified in the 1860s as factories opened up in Germany. Such dolls were popular in the last decades of the nineteenth century (Lima 2012:67-68).

The marbles are comprised of a clay marble and a machine-made swirl marble that postdates 1900 (Plate 54) (Kenyon 1981).

6.2.6.6 Lot 321 Specialized Tools

The specialized tools from Lot 321 (n=13) consist of nine glass kerosene lanterns fragments and four small syringe plunger fragments.

Syringes are multifunction tools. They could be used to apply anesthetics, serve as douches, drain wounds, provide enemas, and mix chemicals together. Their use may not necessarily be medicinal. Given the small size of the syringe in this context it is unlikely that it was used to drain wounds, provide enemas, or for vaginal purposes (Veit 1996:43), it is thus likely that it was used to either apply anesthetics or mix chemicals together. The size of the plungers indicates that they could have allowed them to be used for a variety of purposes.

The kerosene lantern fragments are made of ruby red glass that is commonly used for carriage/car tail lights. One of them is embossed with the maker's name "JEFFERSON." Unfortunately, no details on this manufacturer were found.

6.2.6.7 Lot 321 Writing Tools

Writing tools consist of one wooden pencil fragment that has traces of purple colour on the exterior and is missing its lead core.

6.2.6.8 Lot 321 Miscellaneous Tools and Equipment Items

The miscellaneous tools and equipment items (n=35) consist of seven pieces of electrical wire, 14 insulator fragments, one wagon licence plate, and 13 pieces of solder. Among the insulator fragments, 12 are porcelain and two are glass. The porcelain insulators consist of one cleat and 11 knob fragments.

The wagon licence plate is embossed with the letters "WAGON. G. S. – M. D. / O. C. Co / II / 1910 / Reg No 338" (Plate 74). The letters indicate that this was a plate for a general service wagon of the Department of Militia and Defence. The plate dates from 1910 and has the registration number of 338. It is uncertain what "O. C. Co" might refer to but it has been suggested that it either belongs to the Ottawa Car Company or Oshawa Carriage works (Kevin Hebib, personal communication, 2012).

6.2.7 Lot 321 Indeterminate Class

There are 1,270 artifacts in the indeterminate class from Lot 321. These comprise 12.2 percent of Lot 321's assemblage. They consist of 854 unidentifiable container fragments, 11 pieces of cuprous scrap, two fragments of lead scrap, 124 pieces of ferrous scrap metal, and 279 other miscellaneous items that could not be assigned to a functional class (Table 15).

6.2.8 Lot 321 Pre-Contact Artifacts

Nine pre-contact aboriginal artifacts were recovered from Lot 321 (Plate 59). All consist of lithic shatter debitage (Table 15). Seven of the lithics are from Onondaga chert, one is from Lockport chert, and one is Kettle Point chert. One of the Onondaga chert flakes is a distal flake fragment while another is a distal flake fragment with dorsal and lateral retouch. The Kettle Point chert artifact is also a distal flake fragment.

6.3 Refuse-Filled Depressions

As previously mentioned, nine of the refuse-filled depressions identified during the excavation contained artifacts. They consist of Lots 323, 325, 326, 327, 332, 334, 336, 338, and 386. Analysis of the datable artifacts indicate that Lots 332 and 334 were filled in around or before 1830, Lots 323, 326, 327, and 336 were filled in between 1830 and 1900, and Lots 325 and 338 were filled in during the twentieth century. The date for when Lot 386 was filled in could not be surmised.

6.3.1 Lot 323

Artifacts from Lot 323 consist of four refined white earthenware sherds, one unidentifiable sherd, and two mammal bones. Three refined white earthenware sherds display a black-printed motif while the other sherd is blue-printed.

6.3.2 Lot 325

Artifacts recovered from Lot 325 consist of 30 architectural class items, 43 kitchen and food artifacts, 117 organic artifacts, four personal artifacts, and 11 artifacts that could not be identified.

The architectural class items consist of one machine cut nail, three wire nails, three indeterminate nails, and 23 pieces of window glass. Faunal material consist of 91 mammal bones, three fish bones, two shells, and three burned bone fragments. The personal artifacts consist of three smoking pipe stem fragments and one four-hole sew through bone button that is 17 mm in diameter.

The kitchen and food artifacts consist of one glass liquor container fragment, eight pearlware sherds, 16 refined white earthenware sherds, three ironstone sherds, 14 coarse red earthenware sherds, and one unidentifiable sherd. The chronologically relevant motifs displayed in this collection consist of two

sherds painted in early palette colours, three monochrome blue-painted sherds, one sherd painted in late palette colours, one spongeware sherd, two black-printed sherds, and three blue-printed sherds.

6.3.3 Lot 326

Two artifacts were recovered from Lot 326 - a monochrome blue-painted refined white earthenware sherd and a coarse red earthenware sherd.

6.3.4 Lot 327

Lot 327 produced 375 artifacts of which 12 are in the architectural class, 89 are kitchen/food-related items, 260 are in the organic class, five are in the personal class, one in the tools and equipment class, and eight artifacts are indeterminate.

Architectural class items consist of one tiny brick fragment, eight hand-wrought nails, and three pieces of window glass. Organic class items comprise 50 mammal bones and 210 burned bones. Personal class items consist of two multi-faceted hexagonal blue glass beads, two smoking pipe stem fragments, and one incomplete shell button. The tools and equipment class artifact is a tiny piece of wire. The indeterminate objects consist of three unidentifiable container glass fragments, three pieces of scrap, and two unidentified objects.

Non-ceramic kitchen/food related items consist of one glass liquor container fragment and one pewter tea spoon handle. Among the ceramic sherds, 17 sherds are pearlware, 58 sherds are refined white earthenware, one sherd is bone china, and 11 sherds are unidentifiable. The chronologically diagnostic motifs consisted of two blue scallop-edged sherds, three monochrome blue-painted sherds, nine olde blue-printed sherds, and 52 blue-printed sherds.

Four unique vessels were identified among the Lot 327 assemblage: A blue-printed refined white earthenware teacup with a floral motif (Cat. #4257), a blue-printed refined white earthenware saucer with a floral motif on the brim and an exotic motif in the centre (Cat. #4272) (Plate 75), a blue-printed refined white earthenware muffin plate with a floral motif on the brim (Cat. #4256), and an olde blue-printed pearlware twiffler plate with a floral motif on the brim scalloped and bead-embossed edge (Cat. #4258) (Plate 43).

The saucer displays a printed "DAVENPORT" maker's mark indicating that the vessel was produced by the Davenport factory in Longport as part of the Staffordshire Potteries. Printed Davenport marks postdate 1815 (Godden 1991:189). Above the maker's mark, the plate also displays the pattern name "Villaris" inside an oval surrounded by scrolls.

6.3.5 Lot 332

There are 198 artifacts in the Lot 332 assemblage including 22 architectural class artifacts, 59 kitchen/food artifacts, 35 organic items, 10 personal class artifacts, 64 tools and equipment class artifact, and eight indeterminate artifacts.

Architectural class items consist of seven hand-wrought nails, 12 machine-cut nails, and three indeterminate nails. Four mammal bones and 31 burned bones constitute the organic items class. Personal class artifacts consist entirely of smoking pipe fragments. Tools and equipment class consists of one round metal rod, six bucket rim fragments, and 57 bucket scraps from a single bucket. Indeterminate artifacts consist of one unidentifiable container fragment, six ferrous scrap metal fragments, and one miscellaneous unidentifiable item.

Non-ceramic kitchen and food items consist of two dark green glass liquor container fragments and one complete ferrous metal kettle (Plate 76). Ceramics from this lot consist of 13 pearlware sherds and 43 refined white earthenware sherds. Chronologically diagnostic ceramics consist of two blue edged sherds, five early palette-painted sherds, five monochrome blue-painted sherds, one olde blue-printed sherd, and five blue-printed sherds.

Four unique vessels were identified within this assemblage: A pearlware early palette-painted teacup (Cat. #2696), a pearlware olde blue-printed saucer (Cat. #2698), a refined white earthenware cabled bowl with a herringbone motif along the rim (Cat. #2695) (Plate 77), and a pearlware blue edged salt shaker (Cat. #2675) (Plate 78). The bowl is of a London-shape , a popular hollowware shape between 1820 and 1840 (Kenyon 1987; Miller 2011).

6.3.6 Lot 334

Lot 334 assemblage consists of 10 hand-wrought nails, seven refined white earthenware sherds, two enameled bone china sherds, two mammal bones, two fish bones, 32 burned bones, one smoking pipe stem, one stoneware blacking bottle sherd, and one unidentifiable container glass fragment. One unique vessel was identified in this assemblage – a blue-printed supper plate with a repeating geometric motif on the brim and a floral motif in the centre (Cat. #6038).

6.3.7 Lot 336

Three artifacts were recovered from Lot 336 - a refined white earthenware sherd and two mammal bones.

6.3.8 Lot 338

Lot 338 contains two nails: one indeterminate and one wire.

6.3.9 Lot 386

The excavation of Lot 386 recovered only one artifact - a metal rod fragment.

7.0 ARTIFACT INVENTORY – CIRCA 1868 CONFIGURATION OF THE ORDNANCE AND SUPPLY YARD

7.1 Lot 309

Thirty-five artifacts were recovered from Lot 309, the lens of dark soil and charcoal within the military store building. The assemblage consists of four machine-cut nails, four wire nails, two pieces of window glass, two refined white earthenware sherds, 16 mammal bones, five smoking pipe fragments, and two unidentifiable container glass fragments. One refined white earthenware sherd has an indeterminate blue-printed motif and one has a monochrome blue-painted motif.

7.2 Lot 317

Lot 317 contains 51 artifacts. These consist of three indeterminate nails, two machine cut nails, seven wire nails, one lamp chimney fragment, one semi-porcelain sherd, 16 blank bullets, one trunk hardware, one unidentifiable container glass fragment, and 13 miscellaneous unidentifiable objects.

The bullets consist of 14 complete .303 blanks with crimped heads (Plate 79), one crimped head fragment, and one complete .303 round without powder (Plate 80). All the complete bullets are head-stamped "DAC." "DAC" stands for the "Dominion Arsenal" in Quebec (Tebbutt 2001). The Dominion Arsenal was the first Canadian government cartridge and shell factory and proofing facility. It was established in 1882 and brought together with other munitions companies as Canadian Arsenals Limited in 1945 (Harris 2012).

The complete .303 round displays additional characters beside the head stamp consisting of "17 VII." This indicates that this is a Mark VII (7) round. The Mark VII weighed 11.3 grams with a muzzle velocity of 740 metres per second. The Mark VII lacks a "Z" at its end indicating that it did not contain smokeless powder. The Mark VII was adopted in 1910 and retained until 1938 when the .303 Mark VIIIZ replaced it. The "17" indicates that it was produced in 1917 (Tebbutt 2001).

7.3 Lot 318

Lot 318, one of the support posts for the military store building, contains 20 artifacts. These consist of two machine-cut nails, four indeterminate nails, six pieces of window glass, one coarse red earthenware sherd, one spike, four unidentifiable container glass fragments, and two miscellaneous unidentified artifacts.

8.0 ARTIFACT INVENTORY – 1910s-1936 EXPANSION OF THE ORDNANCE AND SUPPLY YARD

8.1 Lot 354

Lot 354, the topsoil capped by the forge and carpenter shop soil layers, contained 1,191 artifacts. These are summarized in Table 21 below.

| Artifact Class | Total | | | |
|--------------------------|-------|-----|--------|--|
| Architectural | | 368 | 31.1% | |
| Brick | 3 | | | |
| Nail, hand-wrought | 12 | | | |

| Miscellaneous | 26 | | | |
| Artifact Total | 1,191 | | 100.0% | |

8.1.1 Lot 354 Architectural Class

The architectural class comprises almost a third of Lot 354. This assemblage consists of three brick fragments, 12 hand-wrought nails, 117 machine-cut nails, 125 wire nails, 14 indeterminate nails, and 97 pieces of window glass (Table 21). The range of nail types reflects the construction and refurbishment of timber structures throughout the nineteenth and twentieth centuries.

Three brick fragments come from two individual bricks. Both of the bricks are hand-made, water-struck, stick-trimmed bricks. One of the bricks is a pale red colour, is broken in half, and displays horizontal strike marks. It is 9.8 cm (3 $\frac{7}{8}$ inches) wide and 4.8 cm (1 $\frac{7}{8}$ inches) thick. The other brick mends from

two broken halves. It is dark red in colour, displays vertical strike marks, and is $21.5 \text{ cm} (8 \frac{1}{2} \text{ inches})$ long, 10.2 cm (4 inches) wide, and $5.3 \text{ cm} (2 \frac{1}{8} \text{ inches})$ thick.

As the name suggests, hand-made bricks were formed by hand by pouring clay into a wooden mould (Gurcke 1987:102). These bricks can be subdivided into stick-trimmed and metal-trimmed bricks depending if the excess clay was cleared away with either a metal blade or a smooth piece of wood from the mould. The metal blade leaves deep cuts and tears in the brick as it slices away the extra clay while a wooden strike leaves shallow parallel lines (Gurcke 1987:103). The direction of the strike – horizontally, vertically, or diagonally was left at the hands of the individual brick maker and can identify individual styles.

The means to lubricate the brick out of the mould, usually with sand or water, also leaves tell-tale marks which can also be used to classify a brick. Sand gives the brick a rough, granular texture on all sides except the struck one and the sand adhering to the brick during firing leaves a deeper shade of red (Gurcke 1987:103). In contrast, water leaves small ripples at the bottom and sides of the brick and leaves the sides and corners relatively smooth (Gurcke 1987:106).

8.1.2 Lot 354 Furnishing Class

The Lot 354 furnishing class consists of three light bulb glass fragments and two cuprous tacks for furniture legs (Table 21). Similar tacks have been recovered in Lots 321, 353, and 362.

8.1.3 Lot 354 Kitchen/Food-related Class

The Lot 354 assemblage contains 528 kitchen and food-related artifacts comprising 44.3 percent of the Lot 354 assemblage (Table 21). These artifacts relate to the storage, preparation, distribution, and consumption of food and beverages.

8.1.3.1 Lot 354 Ceramics

Lot 354 contains 358 ceramic sherds that consist of eight pearlware sherds (2.2 percent), 281 refined white earthenware sherds (78.5 percent), 29 ironstone sherds (8.1 percent), four yellow ware sherds (1.1 percent), seven semi-porcelain sherds (2.0 percent), 10 coarse red earthenware sherds (2.8 percent), three buff earthenware sherds (0.8 percent), two stoneware sherds (0.6 percent), and 14 unidentifiable sherds (3.9 percent). A summary of decorative motifs from Lot 354 is provided in Table 22.

| Style | Date Range | No. sherds Lot 354 | % of decorated ceramics | |
|-------------------------------|------------------|--------------------|-------------------------|--|
| Hand-painted, monochrome blue | 1780-1835 | 3 | 5.2% | |
| Edgeware, blue scalloped | 1800-1840 | 1 | 1.7% | |
| Transfer print, olde blue | 1815-1835 | 1 | 1.7% | |
| Transfer print, blue | 1820-present | 23 | 39.7% | |
| Transfer print, black | 1830-1840 | 3 | 5.2% | |
| Transfer print, brown | 1830-1860; 1880s | 5 | 8.6% | |
| Hand-painted, late palette | 1830-1870 | 4 | 6.9% | |
| Sponged | 1840-1870 | 13 | 22.4% | |

| Style | Date Range | No. sherds Lot 354 | % of decorated ceramics |
|----------------------|------------|--------------------|-------------------------|
| Edgeware, straight | 1840-1885 | 1 | 1.7% |
| Transfer print, flow | 1844-1900 | 1 | 1.7% |
| Rockingham | 1855-1890 | 3 | 5.2% |
| Total | | 58 | 100.0% |

Table 22: Refined Ceramic Decorative Styles in Lot 354 and Approximate Date Ranges in Ontario

Based on the ware and decorative types within Lot 354, the ceramic assemblage dates mostly to the first half of the nineteenth century though the deposit was not capped until the twentieth century.

Turning to a discussion of vessel uses, Lot 354 contains 18 kitchenware sherd, 321 tableware sherds, and 19 teaware sherds. Three unique vessels were identified this this lot: An ironstone saucer with an indeterminate moulded motif (Cat. #4581), a refined white earthenware late palette painted cup with a red line below the rim on the interior and exterior (Cat. #2923), and a refined white earthenware blue scalloped meat dish (Cat. #1830) with an embossed motif that was popular between 1823 and 1835 (Miller 2000:3; Plate 43).

8.1.3.2 Lot 354 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts from Lot 354 consist of 167 dark olive green glass liquor container fragments, two glass stoppers, and one utensil – a spoon (Table 21).

8.1.4 Lot 354 Organic Class

One tenth of the Lot 354 assemblage consists of faunal remains, including one avian bone, one fish bone, 117 mammal bones, one shell, four burned bones, and seven unidentifiable faunal fragments (Table 21).

8.1.5 Lot 354 Personal Class

Thirty-seven artifacts in the personal class were recovered from Lot 354. These include one incomplete glass button, 34 smoking pipe fragments, and two toothbrush fragments (Table 21).

The smoking pipe fragments comprise 21 bowls and 13 stems. Three of the stem fragments have identifiable maker's marks. These are summarized in Table 23 below.

| Table 23: Identifiable Pipe Maker's Marks from Lot 354 | | | | |
|--|-------------|-------------------|-------------|--|
| Cat. # | Provenience | Maker's Mark | Date* | |
| 12,275 | 702N-287E | MURRAY-GLASGOW | 1833 – 1861 | |
| 12,562 | 703N-287E | MURRAY-GLASGOW | 1833 – 1861 | |
| 12,285 | 702N-288E | W & D BELL-QUEBEC | 1862 – 1877 | |

Lot 354 contains 43 tools and equipment items. They consist of 15 armament items, 22 hardware items, five insulators, and one writing artifact – a slate pencil (Table 21). Armament objects consist of one percussion cap, three minié balls (Plate 67), 10 shell casing fragments, and one cuprous barrel hoop fragment from the Grand Magazine explosion. The hardware items consist of three bolts, two large grommets, one rod, nine screws, three pieces of strapping, three tacks, and one piece of wire.

The shells consist of two .303 shell casings and eight shotgun shells. All insulator fragments are porcelain. Four are knob fragments and one is a cleat fragment.

8.1.7 Lot 354 Indeterminate Class

There are 79 artifacts in the indeterminate class from Lot 354. They consist of 50 unidentifiable container fragments, three pieces of ferrous scrap metal, and 26 other miscellaneous items that could not be assigned to a functional class (Table 21). One of the unidentifiable container glass fragments is solarised.

8.2 Lot 385

A total of 604 artifacts was recovered from Lot 385, the fill used to level the ground before the construction of the carpenter shop, and these are summarized in Table 24 below.

| Artifact Class | Total | | ss Total as Percent of Lot 385 |
|-------------------------|-------|-----|--------------------------------|
| Architectural | | 379 | 62.7% |
| Brick | 1 | | |
| Drainage Pipe | 1 | | |
| Nail, hand-wrought | 2 | | |
| Nail, machine cut | 16 | | |
| Nail, wire | 152 | | |
| Nail, indeterminate | 3 | | |
| Window Glass | 204 | | |
| Furnishing | | 6 | 1.2% |

| Unidentifiable Container | 53 | | | | |
| Ferrous Scrap Metal | 4 | | | | |
| Miscellaneous | 12 | | | | |
| Artifact Total | 604 | | 100.0% | | |

8.2.1 Lot 385 Architectural Class

Most of the artifacts recovered from Lot 385 belong to the architectural class. These artifacts consist of one brick fragment, one drainage pipe fragment, two hand-wrought nails, 16 machine-cut nails, 152 wire nails, three indeterminate nails, and 204 pieces of window glass (Table 24). The presence of wire nails along with hand-wrought and machine-cut nails denotes the mixed nature of this deposit. The red brick fragment is hand-made, water-struck, and stick-trimmed. It is 10.3 cm (4 inches) in width and 5.1 cm (2 inches) in thickness.

8.2.2 Lot 385 Furnishing Class

The Lot 385 furnishing class contains six artifacts. These consist of five glass light bulb fragments and one porcelain sconce (Table 25). The sconce is impressed with the moulded lettering "D.E. Co. No. 870". This is the mark of the Dale Electric Company. This company existed between 1908 and 1959 and was a manufacturer of lighting fixtures and parts with offices in San Francisco and Chicago. They specialised in industrial design for lighting large spaces. With the introduction of many new lighting styles and movements such as Victorian Style Lighting, Art Nouveau, Arts and Crafts, and Art Deco in the early twentieth century, many small companies such as Dale Electric started making similar designs and began to compete on a large scale. By the 1950s, the lighting frenzy had died down and Dale Electric was purchased by the Lionel Corporation, an American toy manufacturer and retailer in 1959 (Gantz and Matranga 2005; Gantz 2010).

8.2.3 Lot 385 Kitchen/Food-related Class

The Lot 385 assemblage contains 63 kitchen and food-related artifacts comprising 10.5 percent of this lot's assemblage (Table 24). These artifacts relate to the storage, preparation, distribution, and consumption of food and beverages.

8.2.3.1 Lot 385 Ceramics

Lot 385 contains 58 ceramic sherds that consist of two pearlware sherds (3.4 percent), 23 refined white earthenware sherds (39.7 percent), three ironstone sherds (5.2 percent), nine semi-porcelain sherds (15.5 percent), 10 coarse red earthenware sherds (17.2 percent), four buff earthenware sherds (6.9 percent), one stoneware sherd, and six unidentifiable sherds (10.3 percent). A summary of decorative motifs from Lot 385 is provided in Table 25.

Based on the ware and decorative types within Lot 385, the decorated ceramic assemblage is representative of the early-to-mid nineteenth century, while the undecorated ceramics are representative of the late nineteenth and early twentieth century.

| Style | Date Range | No. sherds Lot 385 | % of decorated ceramics |
|-------------------------------|--------------|--------------------|-------------------------|
| Hand-painted, monochrome blue | 1780-1835 | 6 | 37.4% |
| Transfer print, olde blue | 1815-1835 | 1 | 6.3% |
| Transfer print, blue | 1820-present | 6 | 37.4% |
| Transfer print, red | 1828-present | 1 | 6.3% |
| Transfer print, black | 1830-1840 | 1 | 6.3% |
| Rockingham | 1855-1890 | 1 | 6.3% |
| Total | | 16 | 100.0% |

Table 25: Refined Ceramic Decorative Styles in Lot 385 and Approximate Date Ranges in Ontario

Turning to a discussion of vessel uses, Lot 385 contains 14 kitchenware sherds, 40 tableware sherds, and four teaware sherds. Two unique teacups were identified in this lot. Both are undecorated semi-porcelain cups (Cat. #2283 and #2295). One of the cups is complete except for the handle. The cup is a low squat shape that was popular at the end of the nineteenth century (Kenyon 1987). The cup is peculiar in that it contains slag that seems to have been poured in it intentionally as there are drip marks (Plate 81).

8.2.3.2 Lot 385 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts from Lot 385 consist of one glass liquor container fragment, one soft drink bottle base, one complete cork, one bone-handled utensil, and one glass tumbler base (Table 24). The soft drink bottle base contains embossed lettering "CONTENT/8 OZ. NET."

8.2.4 Lot 385 Organic Class

Forty-one pieces of faunal bone were recovered from Lot 385. They consist of 34 pieces of mammal bones, four avian bones, and three burned bones (Table 24).

8.2.5 Lot 385 Personal Class

The personal class in Lot 385 (n=11) consists of three buttons, two pieces of fabric, one medicine container fragment, and six smoking pipe fragments (Table 24). The two pieces of fabric are from a dyed

cotton twill weave garment that would have been used on something like a vest. The smoking pipes consist of three stem fragments, one bowl fragment, and two fragments that mend into a complete pipe bowl with a broken stem (Plate 82). None of the fragments display identifiable maker's marks.

Among the buttons there are metal, shell, and plastic specimens. The four-hole metal button is 16.8 mm in diameter and contains a deep centre indicating that it was probably a suspender button. The shell button is two-hole sew-through that is 18 mm in diameter suggesting that it was used for outerwear such as a coat or jacket. The last button is a four-hole plastic celluloid button that is 27 mm in diameter and was probably used on outerwear.

8.2.6 Lot 385 Tools and Equipment Class

Thirty-two tools and equipment class artifacts were recovered from Lot 385. They consist of seven armament items, two general tools, 17 hardware items, and eight insulators (Table 24). Five .303 shell casings fragments and two shotgun shells represent the armament items (Plate 71). The hardware items consist of two bolts, two grommets, two screws, one split bolt connector, two pieces of strapping, and seven wires.

The general tools consist of a stoneware blacking bottle sherd and a colourless liquid veneer bottle. The veneer bottle has a rectangular shape with panel side and chamfered corners. The bottle is topped by a Perry Davis-type finish and displays an Owen's suction scar at its base (Plate 83). The Perry Davis-type finish was a common two-part finish on late nineteenth and early twentieth-century bottles (Jones and Sullivan 1989:79). The Owen's suction scar is an attribute of the first viable fully automated process for making glass bottles. The commercial use of this method began in 1904, reached its peak in the 1920s, and ceased by the late 1940s (Jones and Sullivan 1989:39).

The insulators consist of seven porcelain knob fragments and one large brown-glazed porcelain insulator. The brown-glazed insulator has a large hole with remains of a wire going through it. There is rust at the base indicating that it had a metal component. This was a wire holder insulator used for terminating secondary services (Todd 1977:57). The wire holder is impressed with the numbers "1607" on one side and the word "SLATER" on the other (Plate 80). The number probably refers to the type number produced by the company while "SLATER" refers to Slater & Barnard Ltd. of Hamilton, Ontario which was founded in 1907 and produced poleline hardware (Todd 1974).

8.2.7 Lot 385 Indeterminate Class

There are 69 artifacts in the indeterminate class from Lot 385. They consist of 53 unidentifiable container fragments, four pieces of ferrous scrap metal, and 12 other miscellaneous items that could not be assigned to a functional class (Table 24). One indeterminate artifact is a perforated disk that bears a patent mark – "PAT'D 1867 DEC 31."

8.3 Lot 393

The richest deposit within the carpenter shop was Lot 393. It overlay Lot 385 and underlay the subsequent abandonment and demolition lots like 362 suggesting that it relates to the operation within the carpenter shop itself. A total of 1,470 artifacts was recovered from this lot (Table 26).

| Artifact Class | Total | Clas | ss Total as Percent of Lot 393 |
|--------------------------|-------|------------------|--------------------------------|
| Architectural | | <i>512</i> 34.8% | |
| Cuprous Nail | 1 | | |
| Nail, hand-wrought | 7 | | |
| Nail, machine cut | 29 | | |
| Nail, wire | 198 | | |
| Nail, indeterminate | 28 | | |
| Window Glass | 249 | | |
| Furnishing | | 211 | 14.4% |
| Ceiling Lamp | 196 | | |
| Incandescent Light Bulb | 15 | | |
| Kitchen/Food-related | | 216 | 14.7% |
| Container, food | 23 | | |
| Container, liquor | 94 | | |
| Container, milk | 18 | | |
| Kitchenware | 6 | | |
| Stopper | 1 | | |
| Tableware | 73 | | |
| Utensils | 1 | | |
| Organic | | 68 | 4.6% |
| Faunal, burned | 2 | | |
| Faunal, mammal | 66 | | |
| Personal | | 31 | 2.1% |
| Button | 1 | | |
| Fabric | 5 | | |
| Smoking Pipe | 9 | | |
| Toothbrush Box | 16 | | |
| Tools and Equipment | | 58 | 3.9% |
| Animal Husbandry | 1 | | |
| Armament | 2 | | |
| General Tools | 3 | | |
| Hardware | 47 | | |
| Insulator | 3 | | |
| Solder | 2 | | |
| Indeterminate | | 374 | 25.4% |
| Unidentifiable Container | 216 | | |
| Ferrous Scrap Metal | 94 | | |
| Miscellaneous | 64 | | |
| Artifact Total | 1,470 | | 100.0% |

8.3.1 Lot 393 Architectural Class

A third of the artifacts from Lot 393 belong in the architectural class. They consist of one cuprous nail, seven hand-wrought nails, 29 machine-cut nails, 198 wire nails, 28 indeterminate nails, and 249 pieces of window glass (Table 27).

The cuprous nail, one of a handful recovered from the Visitors' Centre excavation, relates to the care taken when handling military Ordnance or other flammable/explosive material. It was probably used in the construction of a box that contained such material as copper does not spark and would not cause an accidental explosion.

8.3.2 Lot 393 Furnishing Class

The Lot 393 furnishing class contains 211 artifacts. These consist of 196 milk glass ceiling lamp fragments, 13 glass light bulb fragments, and two screw-on bases from incandescent light bulbs (Table 26).

8.3.3 Lot 393 Kitchen/Food-related Class

The Lot 393 assemblage contains 216 kitchen and food-related artifacts comprising 14.7 percent of this lot's assemblage (Table 26). These artifacts relate to the storage, preparation, distribution, and consumption of food and beverages.

8.3.3.1 Lot 393 Ceramics

Lot 393 contains 79 ceramic sherds that consist of 30 refined white earthenware sherds (38.0 percent), 19 ironstone sherds (24.1 percent), eight yellow ware sherds (10.1 percent), two semi-porcelain sherds (2.5 percent), three coarse red earthenware sherds (3.8 percent), three buff earthenware sherds (3.8 percent), and 14 unidentifiable sherds (17.7 percent). A summary of decorative motifs from Lot 393 is provided in Table 27.

| Style | Date Range | No. sherds Lot 393 | % of decorated ceramics |
|-------------------------------|------------------|--------------------|-------------------------|
| Hand-painted, monochrome blue | 1780-1835 | 4 | 21.1% |
| Transfer print, blue | 1820-present | 10 | 57.7% |
| Transfer print, red | 1830-1850 | 1 | 5.3% |
| Transfer print, black | 1830-1860; 1880s | 1 | 5.3% |
| Hand-painted, late palette | 1830-1870 | 1 | 5.3% |
| Sponged | 1840-1870 | 1 | 5.3% |
| Total | | 19 | 100.0% |

Table 27: Refined Ceramic Decorative Styles in Lot 393 and Approximate Date Ranges in Ontario

Based on the ware and decorative types within Lot 393, the ceramic assemblage is a mixture of material dating from the 1830s through to the early twentieth century.

The Lot 393 ceramic assemblage consists of six kitchenware sherds and 73 tableware sherds. No unique vessels were identified within this lot.

8.3.3.2 Lot 393 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts from Lot 393 consist of 23 glass food container fragments, 94 glass liquor container fragments, 18 glass milk container fragments, one glass stopper, and one utensil – a teaspoon (Table 26).

Ten of the milk container fragments contain the words "OA," "JOHNSTON," "DAIR_," and "_. 638." These glass fragments belong to a Johnston Brothers milk container.

The teaspoon is a complete tipped-style spoon. Its handle contains a "POTOSI SILVER" trademark. This trademark belongs to Potosi Co., Birmingham that was in operation between 1878 and 1921 (Woodhead 1991:194).

8.3.4 Lot 393 Organic Class

Sixty-eight pieces of faunal bone were recovered from Lot 393. They consist of 66 pieces of mammal bone and two burned bones (Table 26). Much of the faunal material was recovered in unit 704N-275E where 26 pieces of mammal bone were located.

8.3.5 Lot 393 Personal Class

The personal class in Lot 393 (n=31) consists of one incomplete metal button, five pieces of fabric, nine smoking pipe fragments, and part of an ironstone toothbrush box (Plate 84) mended from 16 sherds (Table 26). The smoking pipes consist of three stem fragments and six bowl fragments (Plate 92). None of the fragments display identifiable maker's marks.

The fabric is from a twill undercoat or vest. The vest appears to have been second-rate as it does not contain finished seams or button holes (Plate 85). It is likely that this would have been worn by a civilian or a member of the militia wearing civilian clothes.

8.3.6 Lot 393 Tools and Equipment Class

Lot 393 contains 58 artifacts in the tools and equipment class. They consist of one animal husbandry item, two armament items, three general tools, 47 hardware items, three insulators, and two fragments of solder (Table 26). The animal husbandry item is a horse harness buckle and the armament items are .303 shell casing fragments. The general tools contains one large hammer, one small hammer, and a half of a wrench. The insulators consist of two porcelain knob fragments and one porcelain cleat fragment.

The hardware items consist of one cap, 22 carbon rods, six screws, four spikes, one spring, one piece of strapping, one tack, and 11 wire fragments. It is interesting to note that 19 of the carbon rods are located in unit 702N-275E. The carbon rods are of a uniform size and similar to those recovered from Lot 321. Each is 15.2 cm (six inches) long and 1.9 cm (³/₄ inch) in diameter (Plate 86). Given that a large number of such carbon rods were recovered, they were probably used to power a number of small and portable electrical devices within the carpenter shop before being discarded.

8.3.7 Lot 393 Indeterminate Class

There are 374 artifacts in the indeterminate class from Lot 393. They consist of 216 unidentifiable container fragments, 94 pieces of ferrous scrap metal, and 64 other miscellaneous items that could not be assigned to a functional class (Table 27). The unidentifiable glass includes seven milk glass and three solarized fragments.

8.4 Small Deposits in the Area of the Carpenter Shop

In addition to Lots 254, 385 and 393 that cover a wider area, there are 10 smaller deposits that contain artifacts within the area of the carpenter shop. They consist of Lots 345, 347, 352, 383, 384, 398, 413, 418, 425, and 431. These are summarized below.

8.4.1 Lot 345

Lot 345 (n=157) includes 108 architectural class items, one glass light bulb fragment, 19 kitchen/food-related artifacts, two mammal bones, one shell shirt button, eight tools and equipment class items, and 18 indeterminate class items.

Architectural class items consist of one drainage pipe, one machine-cut nail, 58 wire nails, and 48 pieces of window glass. Tools and equipment class items consist of one bolt, one insulator knob, one screw, three spikes, a thimble, and one wire fragment. Indeterminate class items consist of 14 unidentifiable container glass fragments and four miscellaneous unidentified objects. The kitchen/food-related class items consist of one glass liquor container fragment, two pearlware sherds, 10 refined white earthenware sherd, two semi-porcelain sherds, one coarse red earthenware sherd, one buff earthenware sherd, and two unidentifiable sherds. Four refined white earthenware sherds have blue-printed motifs.

8.4.2 Lot 347

Lot 347 consists of 66 artifacts. These include five machine-cut nails, 31 wire nails, 19 pieces of window glass, one glass food container fragment, five semi-porcelain sherds, one large metal fastener/clamp, three indeterminate container glass fragments, and one miscellaneous unidentified artifact.

8.4.3 Lot 352

Nine artifacts were recovered from Lot 352. These consist of four wire nails, one window glass fragment, one semi-porcelain sherd, and three unidentifiable sherds.

8.4.4 Lot 383

Out of the seven artifacts recovered from Lot 383, three are window glass fragments, one is a glass liquor container fragment, and three are blue-printed refined white earthenware sherds.

8.4.5 Lot 384

Lot 384 was a spread of soil within the centre of the Carpenter Shop. Only 210 artifacts were recovered from this context. These consist of 71 architecture class artifacts, two light bulb glass fragments, 50 kitchen/food artifacts, 20 mammal bones, 11 personal class items, 10 tools and equipment class items, and 46 indeterminate class items.

Architectural class items consist of three coarse red earthenware drainage pipe fragments, five handwrought nails, 12 machine-cut nails, 38 wire nails, seven indeterminate nails, and six window glass fragments. Personal class items consist of one smoking pipe stem and 10 smoking pipe bowl fragments. The bowl fragments are from a Turk's Head pipe (Plate 90) and the stem bears the maker's mark of Bannerman-Montreal. The manufacturer of this pipe was in business between 1857 and 1907 (Kenyon 1984).

The kitchen and food artifacts consist of seven glass liquor container fragments, one colourless glass tumbler, 30 refined white earthenware sherds, eight ironstone sherds, one coarse red earthenware sherd, one buff earthenware sherd, one stoneware sherd, and one unidentifiable sherd. Nineteen sherds display brown-printed motifs, three sherds display blue-printed motifs, and one sherd is Rockingham. One unique vessel was identified – a brown-printed refined white earthenware bowl (Cat. #5607) (Plate 64).

Tools and equipment class items consist of three stoneware blacking bottle sherds, one bolt, three porcelain insulator knob fragments, one nut, one screw, and one corroded .303 shell casing. The indeterminate class consists of 43 unidentifiable container glass fragments and three miscellaneous unidentifiable artifacts.

8.4.6 Lot 398

Twelve artifacts were recovered from the Lot 398 deposit. They consist of one wire nail, three pieces of window glass, two olde blue-printed sherds, four mammal bones, one metal button, and one .303 shell casing. The four-hole button is 16.8 mm in diameter with a concave centre suggesting that it was used as a suspender button (Plate 49).

8.4.7 Lot 413

Seventeen artifacts were recovered from Lot 413. They consist of one machine cut nail, seven wire nails, two window glass fragments, one semi-porcelain sherd, one bolt, one porcelain insulator knob fragment, two spikes, one washer, and one unidentified tool fragment.

8.4.8 Lot 418

There are 63 artifacts in Lot 418. They are comprised of 24 wire nails, 17 light bulb glass fragments, one liquor container glass fragment, one milk container glass fragment, one smoking pipe stem fragment, one tiny syringe fragment, three pieces of wire, 11 unidentifiable container glass fragments, and four miscellaneous unidentifiable items.

8.4.9 Lot 425

Lot 425 was a non-organic white burnt coal ash deposit (n=82) between the carpenter shop and the Ordnance and Supply Yard fence. It consists of one machine-cut nail, four wire nails, 77 window glass fragments, one staple, four unidentifiable container glass fragments, and three miscellaneous unidentified items.

8.4.10 Lot 431

Lot 431 was an iron-stained lens between the carpenter shop and the fence. This lot contains two wire nails, two indeterminate nails, 68 window glass fragments, one staple, one bolt, two carbon rods, one unidentifiable container fragments, four pieces of scrap, and 13 miscellaneous unidentified objects.

8.5 Deposits in the Carpenter Shop Piles

As discussed in Section 4.4.1, the carpenter shop was constructed on a foundation of 26 piles. Twentythree lots related to these piles contained artifacts: Lots 360, 363, 367, 368, 369, 375, 376, 379, 394, 395, 399, 406, 414, 415, 416, 417, 423, 424, 426, 427, 428, 429, and 432. These are summarized below.

8.5.1 Lot 360

Lot 360, a support along the eastern wall, contained 13 wire nails, two window glass fragments, one screw, one spike, and one unidentified artifact.

8.5.2 Lot 363

Lot 363, a support along the eastern wall, contained six mammal bone fragments.

8.5.3 Lot 367

Two wire nails were recovered from Lot 367, a support along the eastern wall.

8.5.4 Lot 368

Lot 368 was an interior pile that contained 12 artifacts. This assemblage consists of one machine cut nail, four wire nails, one window glass fragment, four semi-porcelain sherds, and two unidentifiable container glass fragments.

8.5.5 Lot 369

Twenty-four artifacts were recovered from Lot 369, a support along the eastern wall. The artifacts consist of one hand-wrought nail, 13 wire nails, two pieces of strapping, one unidentified container glass fragment, and seven miscellaneous unidentified artifacts.

8.5.6 Lot 375

One wire nail was recovered from Lot 375, part of support along the eastern wall.

8.5.7 Lot 376

One machine cut nail was found in this context along the eastern wall.

8.5.8 Lot 379

The excavation of Lot 379, another eastern wall support, produced eight artifacts. These consist of two wire nails, one screw, one porcelain insulator knob fragment, and four mammal bone fragments.

8.5.9 Lot 394

Lot 394 was a pile located along the mid-point of the carpenter shop. This lot contains seven artifacts: One wire nail, three small light bulbs, one refined white earthenware sherd, one mammal bone, and one bolt. Two of the light bulbs are represented by bases while one of the light bulbs is complete. The complete light bulb is a Victorian carbon-filament bulb and has a small anchored double loop filament that is typical of those used in most twentieth-century industrial lanterns (Plate 87). This bulb was handmade and had the lighting equivalent of a modern six to ten watt bulb. Carbon-filament light bulbs debuted in the 1890s and continued to be used until 1912 when they were replaced with the powerful tungsten-filament bulb that transformed the lighting and electricity industry (Keene 1918).

8.5.10 Lot 395

One wire nail was recovered from Lot 395, a pile located at the mid-point of the carpenter shop.

8.5.11 Lot 399

Lot 399, a deposited associated with a pile located at the mid-point of the building, contained four artifacts – three wire nails and a complete porcelain insulator knob.

8.5.12 Lot 406

Lot 406, a pile located along the mid-point of the carpenter shop, contained three artifacts – two wire nails and one porcelain insulator knob fragment.

8.5.13 Lot 414

Lot 414, one of the four piles along the western wall of the carpenter shop, contained 32 artifacts. These consist of five wire nails, 24 window glass fragments, two glass liquor container fragments, and one unidentifiable artifact.

8.5.14 Lot 415

Lot 415, a deposit associated with the western wall, contained two artifacts – one wire nail and one window glass fragment.

8.5.15 Lot 416

Three artifacts were recovered from Lot 416, another pile located at the mid-point of the carpenter shop. The artifacts consist of one wire nail, one porcelain knob insulator, and one unidentifiable artifact. The porcelain insulator is embossed with the letters "HEM_." These letters are from the maker's mark of the Hemco Electric Mfg. Co. out of New York, New York (Todd 1977:109). No information could be obtained about this manufacturer.

8.5.16 Lot 417

Lot 417, a deposit associated with Lot 416, contained a porcelain insulator knob fragment.

8.5.17 Lot 423

Seven artifacts were recovered from Lot 423, a pile located in the west portion of the carpenter shop. They consist of four wire nails, one window glass fragment, one brick, and one screw. The brick is a buff, machine-made, vertically extruded specimen that has been horizontally cut. The brick is 22.7 cm (9 inches) long, 10.2 cm (4 inches) wide, and 6.5 cm (2 ¹/₂ inches) thick. The centre of the brick contains a frog that is 14.8 cm (5 ⁷/₈ inches) long, 5.5 cm (2 ¹/₄ inches) wide, and 1.3 cm (¹/₂ inch) deep. Mortar obscures some of its edges.

As the name suggests, the difference between handmade and machine-made bricks is that the latter was made by a machine. Machine-made stiff-mud bricks were formed by two separate processes. First, a column of clay was formed in the extrusion machine which forced the clay through a die or mouthpiece. This left rounded corners on the edges of the brick formed by water or steam which was used to lubricate the clay. Next the column of clay was cut producing tell-tale cut marks on both sides of the brick (Gurcke 1987:108). Cutting was done either at the narrow end of the brick, making an "end-cut" brick, or from the widest side of the brick, producing a "side-cut" brick. Masons preferred side-cut bricks given that mortar adhered better to the rougher top and bottom surfaces of the side-cut bricks. The blade itself could be positioned to cut the column vertically, horizontally, or sideways depending on the machine (Gurcke 1987:109).

Soft-mud, machine-made bricks were available as early as the late nineteenth century. In Ontario, the machine-made brick postdates 1887. Before that date, bricks were handmade as it was believed that Ontario clay was unsuitable for manufacturing pressed machine-made brick (Yundt and Augaitis 1992:2).

8.5.18 Lot 424

Lot 424, a pile located in the west portion of the structure, contained three machine-cut nails and three wire nails.

8.5.19 Lot 426

Eight artifacts were recovered from Lot 426, one of the piles along the western wall. The artifacts consist of seven wire nails and one piece of window glass.

8.5.20 Lot 427

Lot 427, the clay cap above Lot 426, contains 12 artifacts. These artifacts consist of eight wire nails, one unidentifiable hardware artifact, two fragments from a corroded enamelware cup, and a miscellaneous unidentifiable artifact.

8.5.21 Lot 428

Lot 428, the deposit associated with Lot 429, contains two unidentifiable items.

8.5.22 Lot 429

Lot 429 was a pile located between the mid-point of the structure and the western wall. Its excavation recovered eight artifacts. The artifacts consist of a one wire nail, three metal bowl fragments, one piece of strapping, and three indeterminate ferrous scrap metal fragments.

8.5.23 Lot 432

Lot 432, a pile along the western wall of the carpenter shop, contained two artifacts – a porcelain cleat insulator fragment and an indeterminate metal artifact.

8.6 Lot 353

Lot 353 was the large forge deposit characterized by black grit and sand lensd with ash, coal, and slag. A total of 1,123 artifacts was recovered from this lot (Table 28).

| Artifact Class | Total Class Tota | | ss Total as Percent of Lot 353 |

| Artifact Total | 1,123 | | 100.0% | | |

8.6.1 Lot 353 Architectural Class

Two-thirds of all the artifacts recovered from Lot 353 consist of architectural class items. These consist of three cuprous nails, two drainage pipe fragments, one hinge, 28 hand-wrought nails, 35 machine-cut nails, 375 wire nails, 25 indeterminate nails, and 244 window glass fragments (Table 28).

8.6.2 Lot 353 Furnishing Class

The furnishing class (n=24 artifacts) is comprised of one drawer handle, 14 cuprous furniture leg tacks, a fuse, a small hinge, four glass light bulb fragments, and two light bulb fragments (Table 29). The fuse is inscribed with "ROYAL" and "125V." This indicates that the fuse could carry up to 125 volts of electricity and that it was produced by the Royal Electric Company, a Montreal-based company that was founded in 1884 (Hydro-Quebec 2013). One of the light bulb fragments is part of the dark glass base. The other fragment consists of a complete light bulb base along with part of the interior glass bulb and tube around which wires were wound suggesting a post-1910 date.

8.6.3 Lot 353 Kitchen/Food-related Class

The Lot 353 assemblage contains 80 kitchen and food-related artifacts comprising seven percent of this lot's assemblage (Table 28). These artifacts relate to the storage, preparation, distribution, and consumption of food and beverages.

8.6.3.1 Lot 353 Ceramics

Lot 353 contains 28 ceramic sherds that consist of seven refined white earthenware sherds (25.0 percent), three ironstone sherds (10.7 percent), 15 semi-porcelain sherds (53.6 percent), two coarse red earthenware sherds (7.1 percent), and one unidentifiable sherd. Six sherds have chronologically diagnostic motifs. One of the sherds is monochrome blue-painted, three are sponged, one is pink-printed, and one displays the twentieth-century decalcomania motif.

8.6.3.2 Lot 353 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts consist of two bottle caps, 41 glass liquor container fragments, eight glass milk container fragments, and a single cork. All the milk container fragments comprise finishes with capseat ledges (Table 28).

8.6.4 Lot 353 Organic Class

Eleven mammal bones and one burnt bone comprise the organic class in Lot 353 (Table 28).

8.6.5 Lot 353 Personal Class

Thirteen artifacts from the personal class in Lot 353 consist of one belt buckle, one button, one coin, seven pieces of plain weave fabric, one ring, and two smoking pipe bowl fragments (Table 28). The ring is an almost complete aluminum ring with an inlaid green glass imitation of emerald (Plate 44). The plain weave fabric is most likely from a shirt or undergarments.

The coin is a nickel that has been extremely corroded through some sort of a chemical process but the 1947 date is still legible indicating that it is probably an intrusive artifact introduced from the upper strata through bioturbation.

The button from this assemblage is a metal leather-covered button. The slit where the leather was inserted and the stitch marks where the whole metal support was covered with leather are still present. Leather buttons were mainly used on coats and other outer garments in the early twentieth century (Meredith and Meredith 2004:34-35).

8.6.6 Lot 353 Tools and Equipment Class

Lot 353 contains 58 artifacts in the tools and equipment class. They consist of one animal husbandry artifact – a horse shoe nail, four armament items, one clip, one electrical wire, two general tools, 47 hardware items, one piece of solder, and one recreation artifact – a clay marble (Table 28). The armament items consist of two .303 shell casings, a lead bullet, and the cuprous tip of a pistol or musket

ramrod. One of the .303 shell casings is stamped with the initials "DAC." The lead bullet is a .45 calibre bullet from a Westley Richards rifle.

The hardware items consist of 23 bolts, one fastener, one large grommet, two cuprous tacks, one nut, one ring, two rods, 10 screws, one spike, one piece of strapping, three washers, and one wire.

8.6.7 Lot 353 Indeterminate Class

There are 223 artifacts in the indeterminate class from Lot 353. They consist of 162 unidentifiable container fragments, one piece of ferrous scrap metal, and 60 other miscellaneous items that could not be assigned to a functional class (Table 28). Out of the unidentifiable glass fragments six are solarized.

8.7 Small Deposits in the Area of the Forge

In addition to Lot 353, four smaller deposits contain artifacts within the area of the forge. These consist of Lots 343, 357, 364, and 365.

8.7.1 Lot 343

Lot 343 was an indeterminate ash lens mixed with coal and clinker. Its assemblage consists of one hand-wrought nail, three machine-cut nails, 57 wire nails, two drawer handles, one screw, and one piece of ferrous scrap metal.

8.7.2 Lot 357

Lot 357 was an indeterminate deposit sandwiched between Lots 353 and 354 in unit 702N-288E. Its excavation recovered 10 wire nails, one piece of window glass, one complete carving knife, one undecorated semi-porcelain sherd, and two unidentifiable container glass fragments.

8.7.3 Lot 364

Lot 364, the working area for the forge, contained 25 artifacts. These consist of two machine-cut nails, nine wire nails, one piece of window glass, two liquor container glass fragments, one .303 rifle oil container, one bolt, three screws, one strap loop, four unidentifiable container glass fragments, and one miscellaneous unidentified artifact.

The .303 rifle oil container is complete and sealed with the leather washer still preserved (Plate88). It is incised with the letters HB-15. The oil bottle was adopted for all .303-inch rifles and carbines on December 19, 1899. A spoon is attached to the leather head which, when unscrewed, would have been used to oil the rifle until the oil was used up (Skennerton 1987:3).

8.7.4 Lot 365

Lot 365 was the fire bed for the forge that consisted of fire-reddened sand. This lot (n=53) consists of one machine cut nail, 21 wire nails, one piece of window glass, five liquor container glass fragments, one bolt, six pieces of fitting, one screw, two staples, six strap loops, eight unidentifiable container glass fragments, and one miscellaneous unidentified object.

8.8 Ordnance and Supply Yard Fence Posts

Three fence posts from the western wall of the Ordnance and Supply Yard contained artifacts – Lots 434, 438, and 439.

8.8.1 Lot 434

Lot 434 (n=39) consists of two machine-cut nails, 28 wire nails, one .303 shell casing, one complete porcelain knob insulator, and six indeterminate artifacts.

8.8.2 Lot 438

Lot 438 (n=118) consists of nine indeterminate nails, 25 ironstone sherds, two glass liquor container fragments, 21 glass milk container fragments, one piece of electrical wire, 39 unidentifiable container glass fragments, and 21 miscellaneous unidentified artifacts.

Three of the milk containers were partially reconstructed. All three are made from colourless glass and have capseat ledges and Owen's suction scars. One of the milk containers was made for the Johnston Brosthers Oakland Dairy and two of the milk containers were made for the City Dairy Co. (Plate 89). As discussed above, the former was in operation between 1916 and 1922 while the latter was in operation between 1900 and 1942.

All of the unidentifiable container glass fragments are colourless and probably are also from milk containers.

8.8.3 Lot 439

Eighty artifacts were recovered from Lot 439. These consist of one wire nail, 75 milk glass ceiling lamp fragments, one glass liquor container fragment, one ironstone sherd, one "INF" (infantry) epaulette, and one horse shoe nail.

8.9 Miscellaneous Lots

As discussed in the Settlement Patterns Section 4.4, the expanded component of the Ordnance and Supply Yard contained several miscellaneous lots that did not relate to the carpenter shop, the forge, nor the fence. Three of these lots contained artifacts. The artifacts from these lots are summarized below.

8.9.1 Lot 335

The context of Lot 335 was assigned to three flat fragments of sheet metal of indeterminate function that were recovered from unit 704N-300E between Lots 322 and 321.

8.9.2 Lot 341

Lot 341 was the trench cut and fill for the Lot 361 ceramic pipe that diagonally bisected the area between the carpenter shop and forge and the military store. Lot 341 contained 289 artifacts. Of these, 72 artifacts are from the architectural class, 21 are from the furnishing class, 68 are from the kitchen and food class, four are personal artifacts, 35 are from the organic class, 21 are from the tools and equipment class, and 68 artifacts are indeterminate.

The architectural class items consist of one cuprous nail, one hand-wrought nail, eight machine-cut nails, 31 wire nails, one hinge, and 27 pieces of window glass. The furnishings class consists of 20 colourless glass light bulb fragments and one black glass light bulb. The organic class consists of 32 mammal bones and three burned bones. The personal artifacts consist of three smoking pipe fragments and one glass syringe plunger.

The tools and equipment class artifacts consist of one complete cuprous bullet, one .303 shell casing, one stoneware blacking bottle sherd, eight file fragments, one drill bit, three bolts, one cap, one screw, one spike, one staple, one piece of electrical wire, and one machine-made glass swirl marble (Plate 54). Machine-made swirl marbles were developed around the turn of the century are still popular today (Kenyon 1981). The cuprous bullet is a hollow-point with the letters "DC" stamped into one end. It is 13.8 grams (213.0 grains) in weight (Plate 68). This bullet was adopted by the British government in 1897 as the Cartridge S.A. Ball .303 inch Cordite Mark III (Tebbutt 2001; Barnes 2012:385).

The kitchen and food class artifacts consist of three glass liquor container fragments, 45 refined white earthenware sherds, eight ironstone sherds, four yellow ware sherds, two semi-porcelain sherds, three coarse red earthenware sherds, one stoneware sherd, and two unidentifiable sherds. Chronologically diagnostic motifs from this context consist of one monochrome blue painted sherd, two late palette-painted sherds, four spongeware sherds, two black-printed sherds, nine blue-printed sherds, and one brown-printed sherd.

The indeterminate objects consist of 45 unidentifiable container fragments, four pieces of unidentifiable plating, and 19 miscellaneous unidentifiable objects. One of the unidentifiable container fragments is made from solarized glass.

8.9.3 Lot 408

Lot 408 was a deposit (n=864) located between the carpenter shop and the fence line for the Ordnance and Supply Yard. It consists of 732 architectural artifacts, 27 kitchen and food artifacts, eight organic class items, one personal class artifact, 26 tools and equipment class artifacts, and 75 indeterminate artifacts.

The architectural class items consist of seven machine-cut nails, 59 wire nails, nine indeterminate nails, and 657 pieces of window glass. The organic class consists of one fish bone, six mammal bones, and one unidentified bone.

The kitchen and food artifacts consist of one glass liquor container fragment, two capseat finish fragments from milk containers, one refined white earthenware sherd, 20 semi-porcelain sherds, and three coarse red earthenware sherds. Six of the semi-porcelain sherds mend into an undecorated squat teacup.

The personal class consists of a single black glass button that is 23 mm in diameter and has a cross bottony of white stone imbedded in the centre (Plate 49). Cross bottony (or botonny) refers to a cross terminating in three rounded lobes (Webster's Revised Unabridged Dictionary 1913). This button would have been for a coat or a similar piece of outerwear. Given its motif, the button might have some military heraldry symbolism.

The tools and equipment class items consist of six shell casing fragments, four bolts, six screws, one spike, one tack, six pieces of wire, one unidentified hardware item, and one small counterweight for an indeterminate object. The shell casing fragments represent five individual .303 shell casings. Three of the cases are very fragmentary, one is complete, and one is fragmentary but displays a crimped head similar to the ones recovered from Lot 317 and discussed in Section 7.2.

The indeterminate class consists of 54 unidentifiable container fragments, three pieces of ferrous scrap metal, and 18 miscellaneous unidentified objects. One of the glass fragments is milk glass.

9.0 ARTIFACT INVENTORY – LOTS EXTERIOR TO THE ORDNANCE AND SUPPLY YARD

9.1 Lot 389

Lot 389 was a prepared surface of silty clay laid down after the demolition of the Ordnance and Supply Yard. A total of 1,058 artifacts was recovered from this lot and these are summarized in Table 29 below.

9.1.1 Lot 389 Architectural Class

Over half of all artifacts recovered from Lot 389 belong to the architectural class. These artifacts consist of one drainage pipe fragment, two hand-wrought nails, 54 machine-cut nails, 328 wire nails, 36 indeterminate nails, and 179 pieces of window glass (Table 29).

| Table 29: Artifact Totals by Functional Class and Provenience from Lot 389 | | | | | | |
|--|--------|-----|--------------------------------|--|--|--|
| Artifact Class | Total | | ss Total as Percent of Lot 389 | | | |

Table 20. Artifact Tatale by Eu л. -:-~

9.1.2 Lot 389 Furnishing Class

The Lot 389 furnishing class consists of 15 milk glass ceiling lamp fragments and two light bulb fragments (Table 29).

9.1.3 Lot 389 Kitchen/Food-related Class

The Lot 389 assemblage contains 146 kitchen and food-related artifacts comprising 13.8 percent of this lot's assemblage (Table 29).

9.1.3.1 Lot 389 Ceramics

Lot 385 contains 117 ceramic sherds that consist of three pearlware sherds (2.6 percent), 31 refined white earthenware sherds (26.5 percent), 61 ironstone sherds (52.1 percent), one yellow ware sherd, 14 semi-porcelain sherds (12.0 percent), two coarse red earthenware sherds (1.7 percent), two stoneware sherd (1.7 percent), and three unidentifiable sherds (2.6 percent). A summary of chronologically diagnostic decorative motifs from Lot 389 is provided in Table 30.

| Style | Date Range | No. sherds Lot 389 | % of decorated ceramics |
|-------------------------------|--------------|--------------------|-------------------------|
| Hand-painted, monochrome blue | 1780-1835 | 1 | 3.7% |
| Edgeware, blue scalloped | 1800-1840 | 1 | 3.7% |
| Transfer print, blue | 1820-present | 9 | 33.3% |
| Transfer print, green | 1828-present | 12 | 44.5% |
| Wheat pattern | 1860-1900 | 1 | 3.7% |
| Decalcomania | 1880-present | 3 | 11.1% |
| Total | | 27 | 100.0% |

Based on the ware and decorative types within Lot 389, the deposit is mixed with nineteenth- and twentieth-century material.

Turning to a discussion of vessel uses, Lot 389 contains four kitchenware sherds, 104 tableware sherds, and nine teaware sherds. Two unique vessels were identified in this assemblage – an undecorated semi-porcelain saucer (Cat. #4855), and a green-printed ironstone saucer displaying a floral motif (Cat. #4320) (Plate 90).

9.1.3.2 Lot 389 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts from this lot consist of one glass food container fragment, 23 glass liquor container fragments, three glass milk container fragments, one soft drink bottle base, and one glass stopper (Table 29). Two of the milk container fragments possess capseat finishes. The soft drink container is probably a Coca-Cola bottle.

9.1.4 Lot 389 Organic Class

Lot 389 contained thirty pieces of faunal bone. These consist of 29 mammal bones and one shell fragment (Table 29).

9.1.5 Lot 389 Personal Class

The personal class in Lot 389 (n=13) consists of seven buttons, one plastic comb, one collar stud, one shoe grommet, one pocket watch fragment, and two smoking pipe bowl fragments (Table 29). The pocket watch fragment is cuprous and decorated with elaborate scroll work and applied gilt colour. The buttons consist of four prosser ceramic and three shell specimens. One of the ceramic buttons is a four-hole sew through button that is 11 mm in diameter and was probably used on a shirt (Plate 51). Another ceramic button is a four-hole sew through button fragment that is at least 17 mm in diameter; its size suggests that it was utilized as a coat or vest button. The third ceramic button is a two-hole black sew-through button that was 14 mm in diameter and it might have been used on trousers or a vest (Plate 51). The last prosser button is too fragmentary to properly identify.

Among the shell buttons, one is a two-holed sew through button that is 14 mm in diameter and could have been used for a variety of purposes. The second button is 9 mm in diameter with an engraved floral motif and a dome-shaped projection on the underside for an attachment (Plate 91). Given its size and shape, this may have been used on a woman's or child's piece of clothing. The last shell button is too fragmentary to be identified.

9.1.6 Lot 389 Tools and Equipment Class

A total of 29 tools and equipment class artifacts were recovered from Lot 389. They consist of one armament item, one electrical wire, 18 hardware items, five insulator fragments, and four writing artifacts (Table 29). The armament item is a flattened and unfired percussion cap and the writing artifacts are four slate pencils.

The hardware items consist of a pin, three bolts, one eye hook, one piece of fitting, one nut, three screws, three spikes, one spring, one washer, and three pieces of wire. The insulators consist of one knob, three cleats, and one tube fragment. Two cleats were stamped with "CGE," the initials of Compagnie Generale d'Electro-Ceramique. Compagnie Generale d'Electro-Ceramique was one of the largest manufacturers of French incandescent lamps and electric supplies. They started manufacturing porcelain insulators in 1904 at the Ivry-Port (Paris) site (Alsthom 1992).

9.1.7 Lot 389 Indeterminate Class

There are 223 artifacts in the indeterminate class from Lot 389. They consist of 156 unidentifiable container fragments, 18 pieces of ferrous scrap metal, and 49 other miscellaneous items that could not be assigned to a functional class (Table 29). Among the unidentifiable artifacts, 11 are milk glass fragments and six are solarized glass fragments.

9.2 Lot 390

Lot 390 was the A-horizon outside of the Ordnance and Supply Yard that was not capped until 1936. It contained 1,116 artifacts (Table 31).

| Table 31: Artifact Totals by Functional Class and Provenience from Lot 390 | | | | | |

21. Artifact Totals by Eurotianal Class and Dravanianas for ...

9.2.1 Lot 390 Architectural Class

Over a third of all the artifacts from Lot 390 belong in the architectural class. They consist of eight handwrought nails, 137 machine-cut nails, 149 wire nails, 46 indeterminate nails, and 92 pieces of window glass (Table 31). The even mix of nineteenth and twentieth-century nails suggests that deposits in this context accumulated slowly until the early twentieth century.

9.2.2 Lot 390 Furnishing Class

There are 37 artifacts in the Lot 390 furnishing class. These consist of 25 milk glass ceiling lamp fragments, one lamp burner fragment, seven glass light bulb fragments, and four incandescent light bulb fragments (Table 32). The incandescent light bulb fragments are from at least three different light bulbs. One of these can be dated after 1910 as its wire filaments are encased in a glass tube.

9.2.3 Lot 390 Kitchen/Food-related Class

There are 291 kitchen/food-related artifacts in the Lot 390 assemblage. They comprise a quarter of the lot's assemblage (Table 31).

9.2.3.1 Lot 390 Ceramics

Lot 390 contains 179 ceramic sherds that consist of nine pearlware sherds (5.0 percent), 49 refined white earthenware sherds (27.4 percent), 61 ironstone sherds (34.1 percent), six semi-porcelain sherds (3.4 percent), 16 buff earthenware sherds (8.9 percent), seven stoneware sherds (3.9 percent), and 31 unidentifiable sherds (17.3 percent). A summary of decorative motifs from Lot 390 is provided in Table 32.

| Style | Date Range | No. sherds Lot 390 | % of decorated ceramics | |
|-------------------------------|------------------|--------------------|-------------------------|--|
| Hand-painted, early palette | 1780-1835 | 6 | 20.0% | |
| Hand-painted, monochrome blue | 1780-1835 | 1 | 3.3% | |
| Transfer print, olde blue | 1815-1835 | 1 | 3.3% | |
| Transfer print, blue | 1820-present | 14 | 46.7% | |
| Transfer print, black | 1830-1840 | 3 | 10.0% | |
| Transfer print, brown | 1830-1860; 1880s | 2 | 6.7% | |
| Transfer print, flow | 1844-1900 | 1 | 3.3% | |
| Transfer print, teal | 1880s | 1 | 3.3% | |
| Decalcomania | 1880-present | 1 | 3.3% | |
| Total | | 30 | 100.0% | |

Table 32: Refined Ceramic Decorative Styles in Lot 390 and Approximate Date Ranges in Ontario

The chronologically diagnostic wares and decorative motifs date this assemblage from the early nineteenth to the early twentieth century.

Turning to the discussion of vessel uses in Lot 390, 30 sherds are kitchenware and 171 sherds are tableware. No unique vessels were identified within this lot.

9.2.3.2 Lot 390 Non-Ceramic Kitchen and Food Artifacts

The non-ceramic kitchen and food artifacts from this context consist of 48 glass liquor container fragments, 52 glass milk container fragments, and 12 fragments of enamelware (Table 31). Among the

milk container fragments, three mend into a single capseat ledge finish and 49 mend into a Johnston Brothers milk container. The enamelware fragments mend into a single corroded enamelware table plate.

9.2.4 Lot 390 Organic Class

One unidentified and 51 mammal bones represent the Lot 390 organic class (Table 31).

9.2.5 Lot 390 Personal Class

The personal class in Lot 390 (n=25) consists of two buttons, two medicine containers, 15 shoe fragments, five smoking pipe fragments, and one toiletry container (Table 31). The smoking pipes consist of three stem fragments and two bowl fragments. None of the fragments display identifiable maker's marks.

The shoe fragments are from a single shoe that appears to have been for a small child. The shoe was originally either hand-stitched or McKay machine sewed, a method that was widely adopted after 1862 (Stevens and Ordoñez 2005:14). The shoe also displays three metal pegs that were used to repair the shoe and extend its longevity.

Both of the metal buttons are four-hole sew-through buttons with a concave centre. The buttons are 14 mm and 17 mm in diameter. Such buttons were commonly found on suspenders but can also be associated with trousers and work shirts (Lindbergh 1999).

9.2.6 Lot 390 Tools and Equipment Class

Lot 390 contains 22 artifacts in the tools and equipment class. They consist of eight armament items, one indeterminate tool, nine hardware items, one porcelain insulator knob, one recreation item, and two writing artifacts – a pair of slate pencils (Table 31). The recreation item is a "crockery" clay marble with a mottled dark brown glaze (Plate 54).

The armament items consist of one percussion cap and seven shell casings comprising six individual shells. Three of the shell casings are .303 calibre, one is .22 calibre, and two of the shells are from shotguns. One of the shells is from a pinfire shotgun with the inscription "ELEY BROs/16/LONDON" (Plate 92). The pinfire mechanism was an early form of breach loader that was patented in 1835 by Casimir Lefaucheux and became popular in Europe in the middle of the nineteenth century (Newcomer 2010). It was popular on pistols and shotguns and saw wide use during the American Civil War (1861-1865). It dropped out of favour with the proliferation of rim fire and centre fire weapons (Newcomer 2012). Eley Brothers founded their business in London in the 1820s and are still in business today (Harding 2006).

The hardware items consist of one pin, three bolts, one screw, one spike, one spring, and two wires.

9.2.7 Lot 390 Indeterminate Class

There are 257 artifacts in the indeterminate class from Lot 390. They consist of 187 unidentifiable container fragments, six pieces of ferrous scrap metal, and 64 other miscellaneous items that could not be assigned to a functional class (Table 31). Among the unidentifiable artifacts, two are milk glass and 16 are solarized glass.

9.3 Lot 391

Lot 391 was the upper B-horizon outside of the Ordnance and Supply Yard equivalent to Lots 316 and 322. It contained 401 artifacts (Table 33).

| Artifact Class | Total | Cla | Class Total as Percent of Lot 391 | |
|--------------------------|-------|------------|-----------------------------------|--|
| Architectural | | 118 | 29.4% | |
| Nail, hand-wrought | 1 | | | |
| Nail, machine cut | 21 | | | |
| Nail, wire | 19 | | | |

| Artifact Total | 401 | | 100.0% | |

Table 33: Artifact Totals by Functional Class and Provenience from Lot 391

9.3.1 Lot 391 Architectural Class

The architectural class items from Lot 391 consist of one hand-wrought nail, 21 machine-cut nails, 19 wire nails, 22 indeterminate nails, and 55 window glass fragments (Table 33).

9.3.2 Lot 391 Furnishing Class

There are 11 artifacts in the Lot 391 furnishing class. These consist of eight lamp burner fragments, one lamp chimney glass fragment, one wick knob fragment, and one incandescent light bulb fragment (Table 33). Prior to 1878, several variations of the incandescent light bulb were invented though the light was too dim and the light bulbs too short lived to make them practical. In that year, Joseph William Swan produced the first truly functional lamp (Woodhead et al. 1984:71). A year later, Thomas Edison patented his light bulb and in 1881 added the characteristic screw base. Over the subsequent decades more features were added to make the modern incandescent light bulb more long lasting and practical (Woodhead et al. 1984:73).

The incandescent light bulb fragment from Lot 391 is a wire filament encased in a glass tube that dates after 1910 (Woodhead et. al. 1984:73).

9.3.3 Lot 391 Kitchen/Food-related Class

There are 94 kitchen/food-related artifacts in this assemblage (Table 33). They comprise 23.4 percent of Lot 391's assemblage which is significantly less than the analogous Lots 316 and 322.

With the exception of three glass liquor container fragments, all artifacts from this class in this lot are ceramic sherds. These consist of six pearlware sherds (6.6 percent), 52 refined white earthenware sherds (57.1 percent), 15 ironstone sherds (16.5 percent), one yellow ware sherd, one stoneware sherd, and 16 unidentifiable sherds (17.6 percent). Chronologically diagnostic decorative motifs from Lot 391 consist of 10 monochrome blue-painted sherds, three spongeware sherds, and 13 blue-printed sherds. The date range for this ceramic assemblage falls squarely within the nineteenth century.

Turning to the discussion of vessel uses in Lot 391, two sherds are kitchenware, three sherds are teaware, and 85 sherds are tableware. One unique vessel was identified in this lot – a monochrome blue-painted pearlware saucer rim sherd (Cat. #1473) (Plate 40).

9.3.4 Lot 391 Organic Class

Three burned bones and 97 mammal bones comprise the Lot 391 organic class (Table 33).

9.3.5 Lot 391 Personal Class

Ten smoking pipe fragments comprise the Lot 391 personal class (Table 15). They consist of four stem fragments, five bowl fragments, and one pipe stem and bowl fragment. None of the fragments display identifiable maker's marks.

9.3.6 Lot 391 Tools and Equipment Class

Lot 391's tools and equipment class consists of 20 artifacts – one animal husbandry item, 10 armament items, three general tools, and six hardware items (Table 15). The animal husbandry item is a horse shoe and the general tools are stoneware blacking bottle sherds.

The armament items consist of one lead musket ball, four percussion caps (Plate 93), two shell casings, and three cuprous barrel strapping fragments from the Grand Magazine explosion (Table 15). One of the shell casings is a very corroded shotgun shell while the other is a .32 calibre rim-fire shell. The .32 calibre rounds were used for pistols supplied to officers and cavalry units in the mid-nineteenth century (The Upper Canada Historical Arms Society 1992:20-21).

The musket ball is teardrop shaped in profile indicating that it came into contact with a soft object after it was discharged. The ball is 23.1 grams in weight. Using Daniel Sivilich's formula for calculating the hypothetical diameter of a distorted ball, the ball was probably .63 inches in diameter (Plate 94). This is smaller than a Brown Bess musket ball that was greater than .66 inch in diameter but fits with the French Charleyville and American Springfield muskets that fired .63 inch balls (Sivilich 2005:8). While this musket could have been fired by the American forces that attacked York on April 27 1813, it should not be overlooked that the Canadian militia and native allies could have been using the Charleyville muskets. In fact, 30,000 prepared French ball cartridges were stored at the Grand Magazine before the explosion. Thus, it is also possible that this ball came from the explosion and not the fighting during the actual battle (Kevin Hebib, personal communication 2013).

The hardware items consist of two bolts, one tack, and three wires.

9.3.7 Lot 391 Indeterminate Class

Fifty-eight artifacts from Lot 391 are unidentifiable. These consist of 33 unidentifiable container fragments, one piece of ferrous scrap metal, and 24 other miscellaneous items that could not be assigned to a functional class (Table 15). Out of unidentifiable glass fragments seven are milk glass and two are solarized glass.

9.4 Lot 405

Lot 405 was an indeterminate black gritty silty clay loam deposit in units 699N-269E and 699N-270E that contained 49 artifacts. These artifacts consist of four wire nails, two pieces of window glass, three glass liquor container fragments, four glass milk container fragments, four shoe fragments, three unidentifiable container fragments, and 29 unidentifiable objects. The milk container fragments are from two different bottles and display capseat ledges.

Three of the shoe fragments are from a child's shoe that was most likely pegged. The other fragment is from a very small child's shoe and is also pegged with rectangular metal studs.

9.5 Lot 440

Lot 440, possibly a lens of leached soil in unit 702N-271E, contains six mammal bones.

10.0 **ARTIFACT INVENTORY – POST-1936 COMPONENT**

10.1 Lot 359

Lot 359 was a deposit of homogenous black silty clay loam that covered the forge and the eastern section of the carpenter shop. This may represent topsoil that has been altered by the industrial deposits of the forge. A total of 743 artifacts was recovered from this lot (Table 34).

| Table 34: Artifact Totals by Functional Class and Provenience from Lot 359 | | | | |
|--|-------|-----------|-----------------------------------|--|

| Ferrous Scrap Metal | 9 | | | |
| Other | 41 | | | |
| Artifact Total | 743 | | 100.0% | |

10.1.1 Lot 359 Architectural Class

Like most lots from the Fort York Visitors' Centre excavation, Lot 359 consists mostly of architectural class items. These consist of five drainage pipe fragments, eight mortar fragments, five hand-wrought nails, four machine-cut nails, 128 wire nails, nine indeterminate nails, and 196 pieces of window glass (Table 34).

10.1.2 Lot 359 Furnishing Class

There are 35 artifacts in the Lot 359 furnishing class representing 4.7 percent of this lot's assemblage. These consist of five terracotta flower pot sherds, 29 frosted light bulb fragments, and one key (Table 34). Early light bulbs were either left clear or were frosted on the inside like the specimens from Lot 359. After 1925, light bulbs were given a sanity interior that prevented the glare from the bright incandescent filament and helped to disperse the light better (Woodhead et al. 1984:74).

10.1.3 Lot 359 Kitchen/Food-related Class

Only 91 kitchen/food-related artifacts were recovered from Lot 359. They comprise 12.2 percent of the total Lot 359 assemblage. The non-ceramic artifacts from this class consist of four glass food container fragments, 16 glass liquor container fragments, seven glass milk container fragments, and 41 table glass fragments (Table 34). The food container fragments are from a single small colourless glass condiment jar with a threaded lip. The milk container fragments mend into two capseat finishes. The table glass fragments are from a large colourless glass lid for a cake stand. Moulded glass swirls decorate the exterior.

The 23 ceramic sherds recovered from Lot 359 consist of one pearlware sherd, three refined white earthenware sherds, three ironstone sherds, eight semi-porcelain sherds, three coarse red earthenware sherds, and five unidentifiable ceramic sherds. Among the chronologically diagnostic motifs, one sherd is monochrome-blue painted, three are blue-printed, one is purple-printed, and two sherds display the decalcomania motif.

10.1.4 Lot 359 Organic Class

Twelve mammal bone fragments and one burned bone represent the Lot 359 organic class (Table 34).

10.1.5 Lot 359 Personal Class

Only two artifacts in the personal class were recovered from Lot 359 – a plastic comb and a shoulder title (Table 34). The shoulder title has the moulded word "CANADA" (Plate 95). Shoulder titles such as these were worn by all members of the Canadian Expeditionary Force during the First World War (RCASC 2013).

10.1.6 Lot 359 Tools and Equipment Class

The tools and equipment class items from Lot 359 consist of two electrical wires, 43 hardware items, and two porcelain knob insulators (Table 34). The hardware items consist of six bolts, five chain links, one cuprous tack, two large grommets, 12 screws, two spikes, two strap loops, one tack, and 12 pieces of wire.

10.1.7 Lot 359 Indeterminate Class

The indeterminate class (n=200) from Lot 359 consists of 150 unidentifiable container fragments, nine pieces of scrap metal, and 41 other miscellaneous items that could not be assigned to a functional class (Table 34). Out of unidentifiable glass fragments, one fragment is milk glass and one fragment is solarized. Two of the unidentifiable container glass fragments mend into a base fragment with an embossed diamond shape with the letter "D" in the centre.

10.2 Lot 362

Lot 362 was the demolition/fill layer on top of the carpenter shop. It lay directly over the work surfaces represented by Lots 384 and 393 and underlay a thin accumulation of topsoil. A total of 2,704 artifacts was recovered from this lot (Table 35).

| Artifact Class | Total | al Class Total as Percer | |

| Ferrous Scrap Metal | 29 | | |
| Other | 179 | | |
| Artifact Total | 2,704 | | 100.0% |

10.2.1 Lot 362 Architectural Class

Most of Lot 362 consists of architectural class items. This is not surprising given the interpretation of this lot as the demolition layer for the Carpenter Shop. The artifacts in this class consist of two cuprous nails, 39 drainage pipe fragments, one latch hook, 19 hand-wrought nails, 115 machine-cut nails, 744 wire nails, 41 indeterminate nails, and 467 pieces of window glass (Table 35). The predominance of wire nails points to the twentieth-century context of this lot.

10.2.2 Lot 362 Furnishing Class

The Lot 362 furnishing class consists of one decorative bar support, 92 milk glass ceiling lamp fragments, one cuprous table tack, seven terracotta flower pot sherds, 66 incandescent light bulb fragments, and six sconce fragments (Table 35). The light bulb fragments consist of one filament, five light bulb base fragments from two different light bulbs, and 60 light bulb glass fragments.

Four of the sconce fragments are too small to identify while the other two are mostly complete. One of them is a wall sconce with embossed words "D.E. Co./No. 870" in an impressed rectangle while the other is most likely for a ceiling rosettes and has the embossed words "D.E. Co. 2 A. 125V." The former is a two-piece unit with a bayonet plug lock that was used from the early 1900s up to 1920s/30s.

Page 104

10.2.3 Lot 362 Kitchen/Food-related Class

The Lot 362 assemblage contains 283 kitchen and food-related artifacts comprising 11.6 percent of this lot's assemblage (Table 35).

10.2.3.1 Lot 362 Ceramics

There are 117 sherds in the Lot 362 assemblage. These consist of eight refined white earthenware sherds (6.8 percent), 30 ironstone sherds (25.6 percent), 19 semi-porcelain sherds (16.2 percent), two English bone china sherds (1.7 percent), 50 coarse red earthenware sherds (42.8 percent), two buff earthenware sherds (1.7 percent), one stoneware sherd, and five unidentifiable sherds (4.3 percent). Only eight of these sherds display chronologically diagnostic motifs: one monochrome blue-painted sherd, one sponged sherd, three blue-printed sherds, one brown-printed sherd, and two gilded sherds.

Two unique vessels were identified in this assemblage – a bone china teacup with a gilt trim (Cat. #4955) and an undecorated squat semi-porcelain teacup (Cat. #2368).

10.2.3.2 Lot 362 Non-Ceramic Kitchen and Food Artifacts

There are 166 non-ceramic kitchen/food-related artifacts in the Lot 362 assemblage. These consist of two plastic twist-off bottle cap fragments, five glass food container fragments with threaded finishes, 143 glass liquor container fragments, 13 glass milk container fragments, one cork, one fork, and one colourless glass paneled tumbler. Nine milk container fragments have capseat ledges and two are from the City Dairy discussed previously in Section 6.3.3.2.

One of the liquor containers displays an Owen's suction scar and an embossed diamond with a letter "D" in the centre. There is also a letter "K" and the number "1" embossed outside of the diamond. This is a variation of the Dominion Glass Company mark that was introduced after 1940. The "1," in this case, indicates the year, 1941 or 1951. The presence of the Owen's suction scar suggests that this bottle is from 1941 rather than 1951 as the Owens machines were replaced in the late 1940s (Miller and Jorgensen 1986:3-4).

10.2.4 Lot 362 Organic Class

Lot 362 contained 105 faunal fragments, consisting of 18 avian bones and 87 pieces of mammal bones (Table 35).

10.2.5 Lot 362 Personal Class

The 16 artifacts that comprise the Lot 362 personal class consist of one circular clay bead (Plate 47), six buttons, one claspknife, two identity tag fragments, five smoking pipe fragments, and one bone toothbrush (Plate 84) (Table 35). The claspknife is complete; both the wooden handle and the metal blade

are still present. The identity tag fragments are from a single leather suitcase identity tag, the name is no longer legible.

The buttons consist of two shell buttons, two metal buttons, one prosser button, and one plastic button. One of the shell buttons is a worn two-hole sew-through button that is 11 mm in diameter while the other is a four-hole sew-through button that is 22 mm in diameter. The former was probably employed on a shirt, pair of underwear, or trousers while the later was used for a coat.

One of the metal buttons is a single piece 26 mm button with a broken shank. The other is a 23 mm diameter button with two holes. The ferrous metal core is covered by a thin, ornately moulded red celluloid exterior. Both were used for outerwear. The single piece button was most likely for a utilitarian coat while the ornately covered button could have been used on a pair of trousers, a jacket, or a good coat.

The prosser button is a four-hole sew-through button that is 11 mm in diameter that was most likely used on a shirt. The plastic button is a two-hole sew-through button that is 15 mm in diameter. Its size and style suggests that it could have been used for a pair of underwear.

Smoking pipe fragments consist of three bowls and two stems. Both of the stem fragments display impressed maker's marks. One bears the mark of Henderson-Montreal (1847 - 1876) while the other is Bannerman-Montreal (1857 - 1907).

10.2.6 Lot 362 Tools and Equipment Class

Lot 362 tools and equipment class is comprised of one animal husbandry item, one armament item, eight pieces of electrical wire, two general tools, 76 hardware items, 75 porcelain insulator fragments, four recreation items, and one writing artifact (Table 35). The animal husbandry item is one horse harness buckle and the armament item is a shotgun shell casing. The general tools consist of two tool fragments that could not be identified.

The hardware items consist of 15 bolts, one chain link, one cuprous tack, 22 screws, five spikes, two staples, six pieces of strapping, three tacks, five washers, 11 wire fragments, and five unidentified pieces of hardware.

Insulator fragments consist of 64 knob fragments, 10 cleat fragments, and one indeterminate insulator fragment. One of the cleats is embossed with the word "THOMAS" while two cleats are embossed with the words "ASP. Co" (Plate 60). "THOMAS" refers to the Thomas & Sons Company that were founded in 1873 in Liverpool, Ohio as the American Knob Works. The company was reorganized in 1884 to produce low voltage electric porcelain. Insulators bearing the name "THOMAS" date from 1892 and 1957 (Todd 1977:96). "ASP. Co." refers to the Akron Smoking Pipe Company which was founded in 1890 in Mogadore, Ohio. They started producing wiring insulators in 1895. The maker's mark predates April 1920 when the company changed its name to Mogadore Insulator Company (Todd 1977:70).

The recreation items consist of one porcelain doll arm and three marble fragments. The porcelain doll arm was intended to be attached to a cloth body not dissimilar to the doll head recovered from Lot 321 and discussed in Section 6.3.6.5 (Plate 73). The marble fragments represent two marbles - one is a clay marble and the other is a blue glass swirl marble that is mended from two fragments (Plate 54).

The ink bottle is a square glass vessel with the words "CARVER'S/USA" embossed on the bottom. The words refer to Carver's Ink company that was founded in 1858 (Faulkner and Faulkner 2003:41).

10.2.7 Lot 362 Indeterminate Class

There are 531 artifacts in the indeterminate class from Lot 362. They consist of 322 unidentifiable container fragments, one piece of lead scrap, 29 pieces of ferrous scrap metal, and 172 other miscellaneous items that could not be assigned to a functional class (Table 35). Out of unidentifiable glass fragments 36 are milk glass and one is solarized.

10.3 Lot 301

Lot 301 was a deposit of buried topsoil that formed over the *circa* 1868 buildings in Trench 1, and the First World War era buildings in Trench 4, after the 1936 abandonment of the Ordnance and Supply Yard. As such, it was the most recent layer present in the Garrison Common, not including the fills that were removed from the parking lot using the mechanical excavator during the Stage 4 excavation. Lot 301 contained 3,967 artifacts (Table 36) that are summarized by functional class below.

| Artifact Class | Total | | Class Total as Percent of Lot 301 | |
|--------------------------|-------|-------|-----------------------------------|--|

| Artifact Total | 3,967 | | 100.0% | |

10.3.1 Lot 301 Architectural Class

Just under half of the artifacts from Lot 301 are architectural items (n=1,733). Among the nails, there are nine hand-wrought nails, 56 machine-cut nails, 551 wire nails, and 15 indeterminate nails (Table 36). The range of nail types indicates the varied nature of this deposit, but the twentieth-century date is reflected in the preponderance of wire nails. Other items in this class include one latch hook, seven drainage pipe frasgments, and 1,094 fragments of window glass.

10.3.2 Lot 301 Furnishing Class

The Lot 301 furnishing class contains 100 artifacts (Table 36). These are discussed by subclass in separate sections below.

10.3.2.1 Lot 301 Household Accessories

The household accessories subclass consists of 50 terracotta flower pot sherds.

10.3.2.2 Lot 301 Lighting Devices

There are 50 artifacts in this subclass, including seven glass lamp chimney fragments, 42 incandescent light bulb fragments, and one sconce fragment. Seven of the incandescent light bulb fragments mend into two porcelain light bulb bases (Plate 60). These were popular in the early twentieth century. The sconce fragment is embossed with the letters "P & S" and "660W 250V" around the circumference and the letters "P128B" embossed in an impressed rectangle in the centre. "P & S" is the maker's mark of Pass & Seymour Inc. that were founded in 1890 in Solvay (part of Syracuse), New York. They were known for

making specialty porcelain insulators and specialty wiring devices. They are still in business today (Todd 1977:90).

10.3.3 Lot 301 Kitchen/Food-related Class

The Lot 301 assemblage contains 628 kitchen and food-related artifacts comprising 15.8 percent of this lot's assemblage (Table 36).

10.3.3.1 Lot 301 Ceramics

There are 298 sherds in Lot 301. These consist of three Jackfield sherds (1.0 percent), one pearlware sherd (0.3 percent), 36 refined white earthenware sherds (12.1 percent), 155 ironstone sherds (52.1 percent), one yellow ware sherd (0.3 percent), 44 semi-porcelain sherds (14.8 percent), 29 coarse red earthenware sherds (9.7 percent), three buff earthenware sherds (1.0 percent), six stoneware sherds (2.0 percent), one English bone china sherd (0.3 percent), and 19 unidentifiable sherds (6.4 percent). For the most part, early-to-mid nineteenth century decorative motifs are absent from Lot 301. A summary of motifs is provided in Table 37.

| Style | Date Range | No. sherds Lot 301 | % of decorated ceramics | |
|----------------------------|--------------|--------------------|-------------------------|--|
| Edgeware, blue scalloped | 1800-1840 | 2 | 6.1% | |
| Transfer print, blue | 1820-present | 10 | 30.3% | |
| Transfer print, green | 1828-present | 3 | 9.1% | |
| Transfer print, red | 1828-present | 1 | 3.0 | |
| Hand-painted, late palette | 1830-1870 | 1 | 3.0 | |
| Gilt | 1840-present | 1 | 3.0 | |
| Transfer print, teal | 1880s | 10 | 30.3% | |
| Decalcomania | 1880-present | 5 | 15.2% | |
| Total | | 33 | 100.0% | |

In terms of vessel uses, Lot 301 contains 37 kitchenware sherds, 242 tableware sherds, and 19 teaware sherds. Five unique vessels have been identified in this lot and consist of two teacups, including a squat ironstone form (Cat.# 4921) characteristic of the late nineteenth century (Plate 96) and a decalcomania bone china teacup (Cat.# 2202; Plate 39), two saucers (Cat.# 5013, 4412), and one ironstone mug (Cat.# 4460) with a moulded geometric and floral design (Plate 97). One of the ironstone sherds (Cat.# 3730), recovered from unit 703N-269E, contains a maker's mark fragment with the word "England." This sherd postdates 1891 as the McKinley Tariff Act of that year required all manufacturers to list the country of origin of any given item (Miller 2000).

10.3.3.2 Lot 301 Non-Ceramic Kitchen and Food Artifacts

There are 330 kitchen and food artifacts that are not ceramic (Table 36). These consist of two bottle caps, two glass food containers, 250 glass liquor container fragments, 54 glass milk container fragments, seven

glass mineral water container fragments, 12 glass soft drink container fragments, two aqua glass stoppers, and one teaspoon.

One of the milk containers displays the embossed letters "OAKLAND DAIRY/JOHSNTON B./COLL.638." This is the mark of the Johnston Brother's Oakland Dairy who operated between 1916 and 1922 (Phillips 1989:157).

Seven of the mineral water fragments display crown finishes, a style that was patented in 1892 (Jones and Sullivan 1985:79). Seven of the mineral water fragments mend into a bottle produced by James Eves, a soda water manufacturer that operated in Toronto between 1868 and 1876 (Axelson 2000:39). Eight of the soft drink fragments are from Coca-Cola, one is from an indeterminate green soda bottle with a worn out paper label, and four more fragments are from a bottle embossed with the word "Wynola Corp Ltd." Not much is known about Wynola Corporation except that they were producing bottles in the early twentieth century (Axelson 2000:157).

10.3.4 Lot 301 Organic Class

Just over one percent of the Lot 301 assemblage consists of faunal material. Out of the 59specimens that comprise this group, 15 are avian bones, 38 are mammal bones, and six are unidentified bones (Table 36).

10.3.5 Lot 301 Personal Class

There are 57 artifacts in the personal class of Lot 301. These consist of 29 clothing items, three medicinerelated artifacts, 13 personal gear items, and 12 toilet/hygiene items (Table 36). These are elaborated in their subsections below.

10.3.5.1 Lot 301 Clothing Items

A total of 29 artifacts belong to the clothing subclass in Lot 301. These consist of one leather belt fragment, one collar stud, seven button fragments, and 20 shoe fragments.

The collar stud is metal with a mother of pearl inlay and had a detachable pin on a chain that is missing (Plate 45). Two of the buttons are ceramic. One is a four holed sew-through specimen 12 mm in diameter that is painted red around the circumference (Plate 51). The single-hole ceramic button is 17 mm in diameter and was probably attached to a garment with a pin through the centre. Its size and style suggests that it was used on a coat.

The shoes comprise three leather heel fragments, one welt with corroded iron pegs, 10 sole and insole fragments, and six upper fragments. All of the heel fragments appear to have been attached to the shoe with pegs. One of the heels is very tiny and is probably from a shoe of a small child (Plate 98) while another is slightly bigger and was used by a larger child. Two of the identifiable shoes among the sole and insole fragments appear to have been pegged. One of these two shoes is held together with cuprous pegs (Plate 98). These might have been utilized by the Ordnance workers due to the lack of spark risk.

Pegging began in the sixteenth century though by the middle of the nineteenth century pegs were becoming less popular with the proliferation of machine-sewed shoes. After the 1870s, pegs were relegated to heavy boots and cheaper shoes (Stevens and Ordoñez 2005:14). Given the poorer quality and the general discomfort of wearing a stiffer soled pegged shoe, they are associated with the working class after the mid-nineteenth century (Stevens and Ordoñez 2005:22).

10.3.5.2 Lot 301 Medicine

Three medicine-related artifact were recovered from Lot 301. These consist of two body fragments from a colourless glass vial, and a prescription finish. The prescription finish was used on a variety of medicine containers during the late-nineteenth and early-twentieth centuries (Jones and Sullivan 1985:79).

10.3.5.3 Lot 301 Personal Items

Thirteen items are in the personal items subclass: one corroded twentieth century penny, five smoking pipe fragments, and seven epaulette fragments.

The epaulette fragments consist of three "INF" (infantry) insignias (Plate 99), one "257" insignia (Plate 100), two insignias that say "2DB2CO/CANADA" (Plate 100) and one wire eye fragment from a broken epaulette fragment. The "257" insignia refers to the 257 Infantry Battalion. The 257 Infantry Battalion was organized in December 1916 and recruited in Ontario, Quebec, and New Brunswick (Stewart 1970:108). They were sent to the United Kingdom on February 17th, 1917 where they were designated as the 7th Battalion, Canadian Railway Troops (Library and Archives Canada 2012b:684).

The "2DB2CO/CANADA" pin is the insignia of 2nd Depot Battalion 2nd Central Ontario Regiment. The creation of it was authorized by General Order 2 of January 2nd, 1917 and General Order 57 of April 15, 1918 (Library and Archives Canada 2012a:29). The backs of these epaulettes have the maker's stamp "RODEN BROS 1917." Roden Brothers started in Montreal in 1879 as silversmiths and jewelers and opened branches in Toronto and London after 1900. It would appear that they produced metal military pins and insignias during the First World War (Swan 1986).

10.3.5.4 Lot 301 Toilet/Hygiene Items

There are 12 artifacts in the Lot 301 toilet/hygiene subclass: one plastic comb covered in slag, one celluloid comb fragment, and 10 ironstone sherds reconstructed into a toothbrush box.

10.3.6 Lot 301 Tools and Equipment Class

A total of 114 artifacts from Lot 301 belong to the tools and equipment class (Table 36). These consist of two animal husbandry items, 12 armament items, three general tools, 67 hardware artifacts, two recreation

items, one specialized tool, two writing tools, and 25 miscellaneous tools and equipment objects. The subclasses are elaborated on further below.

10.3.6.1 Lot 301 Animal Husbandry Items

The two animal husbandry items are horse shoe nails.

10.3.6.2 Lot 301 Armament Artifacts

The 12 armament items consist of one crimped head .303 bullet blank, two bullets, and nine shell casing fragments. The crimped-headed bullet blank would have been used for training exercises like the loading and reloading of guns or timed trials to fix a jammed gun. One of the bullets is a .303 with a rounded tip and weight of 13.8 grams/ 213 grains (Plate 68), while the other was a live .32 pistol round. The rounded tip bullet was the first to use cordite. It was first adopted by the British military in 1891 as the Cartridge S.A. Ball, Magazine Rifle Cordite Mark I. (Tebbutt 2001; Barnes 2012:386). The live pistol round was analyzed but not retained due to health and safety concerns by the project crew.

The shell casings consist of one shotgun shell, one .22 shell, and seven .303 shells. One of the .303 shells is stamped with "DAC/1912/VII" indicating that this was a Mark VII shell manufactured in 1912.

10.3.6.3 Lot 301 General Tools

One stoneware blacking bottle sherd, one rake, and one other miscellaneous tool comprise the general tool artifact subclass of Lot 301 (n=3).

10.3.6.4 Lot 301 Hardware items

There are 67 hardware items in Lot 301. These consist of seven bolts, one carbon rod, two pieces of fitting, two nuts, three screws, two spikes, four staples, 14 pieces of strapping, two washers, 29 wire fragments, and one miscellaneous hardware item.

10.3.6.5 Lot 301 Recreation Items

Two marbles make up the recreation subclass. This includes a handmade spiral marble that dates from 1840 to 1920 (Plate 54), and a machine-made cat's eye marble that postdates 1950 (Plate 101) (Kenyon 1981).

10.3.6.6 Lot 301 Specialized Tools

The specialized tools from Lot 301 consist of one small syringe plunger fragment.

10.3.6.7 Lot 301 Writing Tools

Writing tools consist of two slate pencils.

10.3.6.8 Lot 301 Miscellaneous Tools and Equipment Items

The miscellaneous tools and equipment items (n=25) consist of four clinker fragments, four pieces of electrical wire, 15 insulator fragments, one electrical socket fragment, and one piece of solder. The socket fragment is an interior component to an early twentieth-century socket or adapter (Plate 60). Sockets were needed to create a new outlet to plug in the steadily growing variety of electric appliances around the turn of the century, while adapters were needed to standardize power systems in an age where every electrical firm had their own special type of fixture (O'Bannon 2010). Given that all light bulbs recovered from this excavation have the Edison-style screw-in bases, it is more likely that this artifact is from a socket rather than an adapter.

Among the insulator fragments, 13 are porcelain and two are glass. The porcelain insulators consist of eight knob fragments, two wire support fragments, one cleat fragment, one telephone knob fragment (Plate 60), and one large brown-glazed pin type insulator (Plate 102). Pin type insulators were used on regular crossarm pins. The large insulator recovered from this context was probably used to carry a high voltage charge as opposed to something low-voltage like a telephone wire (Todd 1977:61). Telephone knobs were used to terminate telephone service loops (Todd 1977:54).

One of the glass insulator fragments is a base for indeterminate type of insulator. It is embossed with the words "THE ELECTRICAL SUPPLY CO./CHICAGO". Little information was derived on this manufacturer except that they were in business by at least 1892 (Banks 2007:43). The other glass insulator fragment is the top part of a saddle groove insulator (Plate 102). Saddle grooves were used to support a line wire at the very top.

10.3.7 Lot 301 Indeterminate Class

There are 1,276 artifacts in the indeterminate class from Lot 301. They consist of 1,027 unidentifiable container fragments, one piece of cuprous scrap, one fragment of lead scrap, 23 pieces of ferrous scrap metal, and 224 other miscellaneous items that could not be assigned to a functional class (Table 36).

Two of the unidentifiable container glass fragments display an embossed diamond with the letter "D" in the centre (Plate 103). This is the mark of the Dominion Glass Company that registered this mark on June 27, 1928 (Miller and Jorgensen 1986:3).

10.4 Small Post-1936 Deposits

A handful of artifact-bearing lots were excavated that date to or after 1936. These were created either during the abandonment of the Ordnance and Supply Yard or were formed directly after that time. While these lots do not always contain chronologically diagnostic post-1936 artifacts, their chronological relationship to the rest of the site was determined through their position in the stratigraphic record. These small deposits consist of Lots 342, 344, 346, 349, 356, 374/381, 377, 380, 388, 396, 397, 403, 420, 442, 443, and 444. They are summarized below.

10.4.1 Lot 342

Lot 342 is the sand fill between the Lot 314 grounding rods and Lot 340 support frame for one of the utility poles. This context (n=20) consists of 13 wire nails, three large grommets, one .22 shell casing, and three unidentifiable objects.

10.4.2 Lot 344

Lot 344 (n=140) includes 99 architectural class items, one glass light bulb fragment, eight kitchen/food related artifacts, seven mammal bones, two pieces of fabric, seven tools and equipment class items, and 16 indeterminate class items.

Architectural class items consist of four machine-cut nails, 47 wire nails, and 48 pieces of window glass. Tools and equipment class items consist of one piece of grape shot, two porcelain insulator knobs, one spike, and three wires. Indeterminate class items consist of nine unidentifiable container glass fragments, one piece of ferrous scrap metal, and six miscellaneous unidentified objects. The kitchen/food related class items consist of one glass liquor container fragment, one refined white earthenware sherd, two ironstone sherds, two coarse red earthenware sherds, and two unidentifiable sherds. One of the ironstone sherds had a flow blue-printed motif.

One of the porcelain insulators bears the maker's mark of Compagnie Generale d'Electro-Ceramique.

10.4.3 Lot 346

Lot 346 is the sand fill between the Lot 314 grounding rods and Lot 351 support frame for one of the utility poles. This context produced 13 window glass fragments, one glass liquor container fragment, seven semi-porcelain sherds, and 11 unidentifiable container glass fragments. The semi-porcelain sherds mend into a short, squat undecorated teacup (Cat. #2450).

10.4.4 Lot 349

Lot 349 is a dark yellowish brown sand layer that caps Lot 344 within the carpenter shop area. It produced six wire nails.

10.4.5 Lot 356

Lot 356 is a mixed deposit of overlying the Lot 92 fill in the Gardiner Expressway cut. This deposit produced 135 artifacts, consisting of one machine-cut nail, 19 wire nails, 66 pieces of window glass, seven glass liquor container fragments, 28 ceramic sherds, one button, three smoking pipe fragments, one file, five large grommets, one nut, and three unidentifiable artifacts. The button is a two-hole sew-through shell specimen that is 12 mm in diameter and was probably used on a shirt.

The ceramic sherds consist of two pearlware sherds, 20 refined white earthenware sherds, two ironstone sherds, one semi-porcelain sherd, one coarse red earthenware sherd, and two unidentifiable sherds. The chronologically diagnostic motifs consist of one black-printed sherd, six blue-printed sherds, and one decalcomania sherd.

10.4.6 Lot 374/381

Lot 374/381 was a cut and fill event that bisected the Lot 384 work surface and was capped by the Lot 362 demolition layer. A total of 332 artifacts was recovered from this layer. These consist of 166 architectural class items, three furnishing class items, 31 kitchen/food class items, 51 organic class items, three personal class items, 23 tools/equipment class items, and 55 indeterminate class items.

The architectural class artifacts are comprised of three drainage pipe fragments, one mortar fragment, six hand-wrought nails, 10 machine-cut nails, 95 wire nails, nine indeterminate nails, and 42 window glass fragments. Furnishing objects consist of three terracotta flower pot sherds. Organic class items consist of 50 mammal bones and one burned bone.

The kitchen/food class objects consist of 10 glass liquor container fragments, two glass milk container fragments, and 19 ceramic sherds. These ceramic sherds consist of one pearlware sherd, five refined white earthenware sherds, five ironstone sherds, three semi-porcelain sherds, two coarse red earthenware sherds, one buff earthenware sherd, and two stoneware sherds. One of the refined white earthenware sherds displays a sponged motif and two refined white earthenware sherds are blue-printed.

The personal class items consist of one unmarked pipe stem fragment, one cuprous four-hole sew-through suspender button 16 mm in diameter, and one toiletry container. The toiletry container consists of a black-printed label on a metal container. The label is bilingual in French and English; the English portion reads "RAMSES QUALITY IS KNOWN_/ OVER THE BEAUTIFUL FINISH_."

Tools and equipment class items consist of one percussion cap, one .303 shell casing, three bolts, two rods, three screws, one tack, one wire, and 11 porcelain insulator fragments. The insulator fragments consist of four cleat fragments and seven knob fragments. Indeterminate artifacts consist of 43 unidentifiable container fragments, one piece of ferrous scrap metal, and 11 unidentified objects. One of the unidentifiable objects is a piece of solarized glass and another unidentifiable container glass fragments displays the Dominion Glass Company maker mark with an embossed "D" inside an embossed diamond.

10.4.7 Lot 377

Lot 377 was a deposit within Lot 374/381 whose fill consisted of gritty coal ash and 12 artifacts. The artifacts consist of two machine-cut nails, two wire nails, one window glass fragment, four unidentifiable container glass fragments, and three other unidentifiable artifacts.

10.4.8 Lot 380

Lot 380 is a deposit related to the demolition and abandonment of the carpenter shop. The artifacts in this lot consist of one wire nail, one bolt, three unidentifiable container glass fragments, and three other unidentifiable artifacts.

10.4.9 Lot 388

Lot 388 is another post-Ordnance and Supply Yard lot located in the southwest corner of the excavation next to the Gardiner Expressway cut and fill. Five artifacts were recovered from this context: one wire nail, one window glass fragment, one glass liquor container fragment, one unidentifiable container glass fragment, and one unidentified artifact.

10.4.10 Lot 396

Lot 396 is an indeterminate brown silty clay loam deposit. Thirty-eight artifacts were recovered from this context. These consist of four machine-cut nails, two wire nails, one indeterminate wire, one glass liquor container fragment, two ceramic sherds, one "INF" epaulette, one percussion cap, one screw, six wire fragments, 15 unidentifiable container fragments, and four other unidentifiable artifacts. Fourteen of the unidentifiable container fragments are pieces from an indeterminate enamelware hollowware container.

The ceramics consist of one blue-printed refined white earthenware sherd and one undecorated ironstone sherd.

10.4.11 Lot 397

Lot 397 is the most recently deposited lot from which artifacts (n=10) were recovered – it is an indeterminate fill that post-dates the construction of the Gardiner Expressway. Thus, this context dates after 1960. The artifacts consist of one wire nail, two indeterminate nails, three window glass fragments, one glass liquor container fragment, one button, one unmarked smoking pipe stem fragment, and one spike.

The button is a spherical cuprous metal button that is 13 mm across and 10 mm thick. Such buttons were popular in the nineteenth century on cuffs on men's shirts and, alternatively, on clothing for women and children (Ferris 1986:99). Its presence in this context speaks to the mixed nature of this deposit that resulted from the construction of the Gardiner Expressway.

10.4.12 Lot 403

Lot 403 is the sand fill between the Lot 314 grounding rods and Lot 402 support frame for one of the utility poles. This context (n=26) consists of 15 wire nails, one window glass fragment, three glass liquor container fragments, two mammal bones, three unidentifiable container solarized glass fragments, one piece of ferrous scrap metal, and one unidentifiable artifact.

10.4.13 Lot 420

This lot is associated with Lot 419, a large square post that cut through the carpenter shop lots. Six artifacts were recovered from this context. These artifacts consist of two wire nails, one fuse, two unidentifiable container glass fragments, and one miscellaneous unidentified artifact. The fuse is embossed with the words "ROYAL" and "V125" and thus is similar to the ones found in Lots 321 and 353.

10.4.14 Lot 442

Lot 442 was a compact deposit of industrial waste located in the northwest corner of the excavation area. A total of 149 artifacts was recovered from this context. These artifacts consist of 33 architectural class items, one light bulb glass fragment, 47 kitchen/food class artifacts, seven tools and equipment class artifacts, and 61 indeterminate artifacts.

The architectural class items consist of one drainage pipe fragment, three hand-wrought nails, two machine-cut nails, 18 wire nails, four indeterminate nails, and five window glass fragments. Tools and equipment class items consist of one screw, one shotgun shell casing, two spikes, one strapping, and two wire fragments.

Kitchen and food class artifacts consist of 12 glass liquor container fragments, one glass milk container fragment, and 34 ceramic sherds. The ceramics consist of one pearlware sherd, 29 ironstone sherds, one semi-porcelain sherd, one coarse red earthenware sherd, and two buff earthenware sherds. The pearlware sherd displays a blue-printed motif.

The Lot 442 indeterminate class objects consist of 39 unidentifiable container fragments, 21 pieces of ferrous scrap, and one miscellaneous unidentifiable object.

10.4.15 Lot 443

Lot 443 was another compact deposit of industrial waste located in the northwest corner of the excavation area. A total of 143 artifacts was recovered from this context. These artifacts consist of 60 architectural class items, seven light bulb glass fragment, 33 kitchen/food class artifacts, two mammal bone fragments, three personal class artifacts, two tools and equipment class artifacts, and 36 indeterminate artifacts.

The architectural class items consist of one cuprous nail, two machine-cut nails, 45 wire nails, and 12 window glass fragments. Personal class artifacts consist of one button, one shoe fragment, and one unmarked smoking pipe stem fragment. The 11 mm diameter button is a four-hole sew-through specimen

that was probably used on a shirt (Plate 51). The shoe fragment is a heel fragment that has been pegged to the sole with iron pegs.

The Lot 443 kitchen/food class is comprised of five glass liquor container fragments, one glass soft drink container fragment, and 27 ceramic sherds. The soft drink fragment is embossed with the word "Pepsi." The ceramics consist of six refined white earthenware sherds, 12 ironstone sherds, five semi-porcelain sherds, two coarse red earthenware sherds, one buff stoneware sherd, and one stoneware sherd. Chronologically diagnostic motifs consist of one black-printed sherd, four blue-printed sherds, one green-printed sherd, and one teal-printed sherd. One unique vessel was identified in this lot – an undecorated ironstone teacup (Cat. #4317).

The tools and equipment class items consist of one large grommet and one wire fragment. The indeterminate class artifacts consist of 24 unidentifiable container fragments, four fragments of ferrous scrap, and eight miscellaneous unidentifiable objects. Two of the unidentifiable container glass fragments are solarized and four are milk glass.

10.4.16 Lot 444

Another industrial deposit identified in the northwestern corner of the excavation area is Lot 444. A total of 27 artifacts was recovered from this context. These consist of one wire nail, 16 window glass fragments, one indeterminate tool fragment, and nine unidentifiable container glass fragments.

11.0 INVENTORY OF THE DOCUMENTARY RECORD

The material relating to the Stage 4 archaeological mitigative excavation for the Visitors' Centre at the Fort York National Historic Site (AjGu-26) is curated by ASI as part of the 2010 and 2011 licensing agreements made with the Ministry of Tourism, Culture, and Sport. The details of this curated material are listed in Table 38.

| Table 36: Malerial | Table 36: Material Curated by ASI from the Fort fork visitors. Centre Excavation | | | |

|-------------------|---|---|
| Artifacts | Archaeological Services Inc., 528 Bathurst Street, Toronto, ON M5S 2P9 | 35,273 Euro-Canadian and 11 pre-contact aboriginal artifacts stored in 53 bankers boxes. All material stored in standard banker's boxes by class and provenience. Collection may be transferred to one of ASI's secure, off-site storage facilities if deemed necessary. |

 Table 38: Material Curated by ASI from the Fort York Visitors' Centre Excavation

12.0 ARTIFACT SPATIAL DISTRIBUTION

The extensive block excavation that comprised much of the Stage 4 fieldwork for the Fort York Visitors' Centre allows for the use of spatial analysis to observe the clustering of certain key artifact types in several lots that were identified over a large area. Similar techniques have been applied with great utility in archaeological investigations of plough-disturbed nineteenth-century farmsteads (see King 1988; Poulton and Dodd 2007; ASI 2011; ASI 2012c).

Spatial analysis was applied to the buried soil horizons on this military site heavily utilized during the late nineteenth and early twentieth centuries in order to ascertain whether or not additional information could be gathered from looking at the spatial distribution of specific artifact types. For this exercise, contexts of a similar nature were grouped together in order to provide larger horizontal extent for the analysis. Lots 322 and 391, the B-horizons, were grouped together; as were Lots 321, 354 and 390, the buried A-horizons; and Lots 353, 364, 365, 384, and 393, the carpenter shop and forge working surfaces. Finally, some small finds from various lots were piece plotted to provide a broader understanding of these objects within the study area. All of this is discussed below.

12.1 Lots 322 and 391 Artifact Spatial Distribution

As was discussed in Section 4.2 above, these lots represent the B-horizon that formed part of the natural stratigraphy together with their topsoils (Lots 321 and 390) prior to the construction of the Ordnance and Supply Yard. Thus, spatial analysis (Figures 21-24) was used to discern whether or not small, ephemeral buildings or other activity areas existed in this area before 1868. The artifact total yields were mapped as a control. The early-to-mid nineteenth-century ceramics, consisting of creamware, pearlware, Jackfield, and refined white earthenware ceramics, were mapped to identify potential midden areas. It should be reiterated, however, that refined white earthenware ceramics continued to be produced into the twentieth century and might not necessarily relate to nineteenth-century activities on the Garrison Common. In addition to the early ceramics, the liquor container glass, faunal material, and smoking pipes were also mapped to help identify potential midden areas. Hand-wrought and machine-cut nails and window glass were mapped to determine whether or not structures existed within the area before the twentieth century. Finally, the Grand Magazine debris was piece plotted.

Figure 21: Spatial distribution of major artifact types in Lots 322 and 391, the B-horizon.

As can be seen from Figure 21, the highest yields in the B-horizon were found in the eastern section of the block excavated area. Most notably, B-horizon yields drop dramatically in the area where the carpenter shop and forge were constructed probably indicating that some of this soil was removed prior to the construction of these buildings. This is supported by the locations of the Grand Magazine debris that was found in Lots 322 and 391 both east and west of these structures but not directly below them.

The artifact yields are greatest on the eastern edge of the block excavated area abutting what would have been the military store. The ceramics, faunal material, smoking pipe fragments, the nails, and to some extent the window glass and the liquor container glass follow the same pattern suggesting that a midden was forming in this part of the Garrison Common even before the establishment of the Ordnance and Supply Yard.

Given the presence of architectural material debris, structures not previously documented may have occupied this location, but it is more likely that the material was introduced in secondary deposits during periodic cleaning episodes inside the fort compound. Indeed, the distribution of the window glass does not correspond to the distribution of the nails. The liquor glass was found in two very centralized locations around units 701N-284E and 704N-292E. These might have been isolated deposits of a few broken bottles.

Thus, the concentration of early-to-mid nineteenth-century material located on the eastern edge of the block excavated area represents debris introduced as secondary deposits in this area before the construction of the Ordnance and Supply Yard. No pre-1900 structures were detected using this approach.

12.2 Lots 321, 354 and 390 Artifact Spatial Distribution

Lots 321, 354 and 390 are buried A-horizon layers that were capped at different times. Lot 354 was capped in the 1910s and 1920s through the construction of the carpenter shop and then the forge while Lot 390 was not capped until 1936 with the deposition of Lot 389. Lot 321 was not capped until the construction of the Gardiner Expressway.

Much like with Lots 322 and 391, the main attempt here was to identify possible ephemeral structures and activity areas before the construction of the Ordnance and Supply Yard. Total artifact yields were mapped as a control followed by liquor container glass, early-to-mid nineteenth-century ceramics, the later ceramics, smoking pipes, faunal material, hand-wrought and machine-cut nails, wire nails, and window glass (Figure 22).

Lot 354 consisted of dense concentrations of early-to-mid nineteenth-century ceramics at 698N-280E and liquor container glass at 704N-288E. These are likely secondary deposits of midden material similar to what was discussed with Lots 322 and 391 above. Most of the artifacts were recovered from Lot 321 and a new location for the primary deposition of late nineteenth-century ceramics is discerned as a sharp line along the west boundary of the Ordnance and Supply Yard fence.

Some window glass was recovered from Lot 354 and was concentrated in unit 699N-285E. Most of the window glass was concentrated in Lot 321 and was probably deposited during the demolition of the Ordnance and Supply Yard given that its distribution pattern is closer to that of the wire nails than the hand wrought and machine cut nails.

Figure 22: Spatial distribution of major artifact types in Lots 321, 354 and 390, the buried A-horizons.

12.3 Lots 353. 364, 365, 384, and 393 Artifact Spatial Distribution

For the work surface layers of the carpenter shop and forge, artifact totals, early twentieth century ceramics (semi-porcelain and ironstone), wire nails, and window glass were plotted (Figure 23). Artifact totals excluded distinctly nineteenth-century items. This mapping was done to ascertain any activity areas related to food consumption within these structures and to better refine the location of the forge which, as previously discussed, does not have a precise location delineated by a line of posts.

Interestingly, most artifacts from these lots cluster between the west carpenter shop wall and the Ordnance and Supply Yard fence. It would appear that this area, approximately a metre across, was a convenient and logical spot to dump garbage. Alternatively, as can be seen by the large window glass concentration in this area, it might have been a window though it would not have provided much light to the building as it would have been perpetually in the shade of the fence line.

Another large area of artifact concentration was along the diagonal boundary of Lot 353. This deposit consisted mostly of wire nails and could thus represent the demolition debris from the forge. The distribution of window glass in Lot 353 matches the diagonal distribution of nails and supports the notion that this lot consists mostly of demolition debris.

Unfortunately, only 66 semi-porcelain and ironstone ceramic sherds were from these lots and their sparse distribution does not follow any distinct pattern. While food was consumed within the shop and forge, as evinced by their presence, most of the refuse had to have been deposited elsewhere.

12.4 Artifact Spatial Distribution of Small Finds

In addition to the spatial analysis of large groups of artifacts as presented above, some of the more interesting small finds were also plotted for the purposes of this report (Figure 24).

Many large grommets were recovered from Lot 321. These might relate to tents or other large canvases that could have been used by the military. While all of them are located on the eastern half of the excavation in the open area between the carpenter shop and the military store, some were located above the forge and carpenter shop lots. Thus they might also relate to the Gardiner Expressway construction and the buildings seen on Plate 4. This could be clarified if the maker for the grommets, "GARY & PRIER. LONDON," was identified.

Of more utility is the location of the bullet casings. In particular, the location of the .303 shells is useful as they could be directly linked to the Canadian military while the .22 shells can designate areas for training the Canadian militia between 1919 and 1939. The locations of shotgun shells and other miscellaneous shells were also plotted. Not surprisingly, most of the shells were located in the open area between the carpenter shop/forge and the military store. However, most of the .22 shells were located adjacent to the military store while the .303 shell casings ran perpendicular to the east wall of the carpenter shop. The reason for this difference in distribution is unknown.

Finally, during the Stage 4 excavation, a large number of children's artifacts were recovered (n=17). These consist of 10 marbles, four shoes, two doll fragments, and one button that could related either to a child or a woman's dress. These were all plotted along with the lot from which they were recovered Figure 24.

Figure 23: Spatial distribution of major artifact types in Lots 353, 364, 365, 384, and 393, working surfaces of the carpenter shop and forge.

Figure 24: Spatial distribution of small finds during the Stage 4 salvage excavation for the Fort York Visitors' Centre.

The artifacts were evenly spread out throughout the area of excavation. At least three child-related artifacts were deposited during the operations of the Ordnance and Supply Yard. The first of these is the porcelain doll head from Lot 321 whose style indicates that it was deposited in the second half of the nineteenth century when the Ordnance and Supply Yard was in operation approximately 15 metres away from where it was abandoned. The second is the glass swirl marble from Lot 341. Not only does this marble provide a *terminus post quem* date of circa-1900 for when this utility trench was dug, it also indicates that enough time passed for it to be lost by a child just outside of the Ordnance and Supply Yard. Finally, the clay marble recovered from Lot 353 is directly related to the life and work of the post First World War Ordnance and Supply Yard as it was found in the forge debris layer.

Other children's objects were recovered from the demolition lots and might have been abandoned around 1936 as the Ordnance and Supply Yard was being dismantled. These consist of the clay and the swirl glass marble recovered from Lot 362 and the button from Lot 389. These artifacts support what has been observed in the photographic record in that children were present at this military facility.

13.0 DISCUSSION

The Stage 4 mitigative excavation of the building envelope for the proposed Visitors' Centre at the Fort York National Historic Site (AjGu-26) was conducted ahead of construction. The site plan changed significantly after the Stage 2 assessment, which focused on the entire Fort York parking lot. Given the change in the Visitors' Centre design, the area subject to excavation was limited to a small sliver of land that was part of the gravel parking lot west of the walled fort, south of Garrison Road, and east of the entrance driveway that extends between Fort York Boulevard and Garrison Road. Thus, most of the archaeological remains documented during the Stage 2 assessment will be preserved in situ as the Visitors' Centre is sited to mostly avoid the sensitive tableland and isolated within the lands cut and filled for the Gardiner Expressway.

The field work was carried out over the 2010 and 2011 field seasons and exposed an area of approximately 370 square metres, of which 290 were stratigraphically block excavated. A total of 152 individual lots was recorded. These ranged from parking lot fill layers and buried soil horizons to small discrete features. All small features were cross-sectioned, drawn, photographed, and 100 percent excavated. In the end, this project produced 35,284 artifacts from 85 lots.

Before the arrival of the Europeans, the tablelands of Lake Ontario were frequented by aboriginal people for millennia. Eleven lithic flakes recovered from Lots 321 and 322 attest to this fact though no diagnostic lithic artifacts were recovered to indicate a specific chronological timeframe for this occupation. More likely, these flakes accumulated over successive temporary visitations to the Ontario shoreline. The evidence for these visits for the most past, however, has been erased by subsequent occupation by the Europeans.

The historic cultural landscape of Garrison Common can be reconstructed using the archaeological strata. Fort York's infamously boggy ground can be detected in the gully and other crevices observed as part of the topography of buried A- and B-horizon surfaces and the presence of wagon ruts that compacted material into the strata below. The depressions were filled in opportunistically with refuse as can be seen through the hodgepodge of artifacts recovered from these lots. Refuse was also deliberately buried as can be seen with Lot 332, a large pit feature containing a complete kettle along with several ceramic vessels. The reason for this single event could not be ascertained.

The refuse-filled depressions, refuse pits, and the light spread of early-to-mid nineteenth-century artifacts points to a continual use of this space by the Fort York garrison. Some of the artifacts recovered from the lower strata, like early ceramics, early marked smoking pipes, the high densities of liquor container glass, and many of the pewter objects, must have originated from the general disposal of refuse outside the walls of the fort. The presence of early armament objects like the Lot 321 flintlock firearm trigger guard, ramrod fragments, gunflints, percussion caps, pinfire shotgun shell, Westley Richards rifle bullets, and minié balls indicate that this area would have been used for military drills before the Ordnance and Supply Yard was built.

The most significant of these early nineteenth-century armament items are the 13 cuprous barrel hoop fragments and the musket ball recovered from the lowest levels of the excavation. These artifacts can be directly linked to the Battle of York that took place on April 27, 1813 and the detonation of the Grand Magazine that killed or wounded a large contingent of the American forces and killed their field commander, the famous explorer, Zebulon Pike. These artifacts are a direct link to the destruction and devastation that rained upon them at the climactic end of the battle. The distorted musket ball is one of the most interesting artifacts recovered from this excavation because its shape suggests it came in contact with a soft object after it was launched. While it cannot be ascertained whether or not this item was discharged by an American firearm or came from the Grand Magazine explosion, this is yet another example of an artifact from this battle. Thus, there is good evidence that the lowest archaeological strata of the Garrison Common should be understood as part of a battlefield site.

Much of the area's archaeological potential, however, comes from the Ordnance and Supply Yard that was constructed just west of the walled fort in 1868. The facilities consisted of a military store, an office, a gun carriage shed, an unidentified structure, and a variety of smaller buildings. The long thin eastern section of the excavation area exposed a little bit of the interior of this compound and documented the engineered pavement previously identified during the Stage 2 excavation (Lot 43) along with the modification of this surface (Lot 306) that introduced some twentieth-century artifacts into this deposit.

Evidence of the military store was found along the eastern edge of the excavation. It was restricted to piles located along the east wall of the building (Lots 309, 312, 317 and 318). A limited number of artifacts were recovered from these lots, including machine-cut and wire nails as well as refined white earthenware, ironstone, and semi-porcelain ceramics, with the exception of Lot 317, which contained the largest single cache of ammunition recovered from the excavation. This ammunition, consisting of blank .303 rounds, was manufactured during the First World War for training purposes. A piece of planed wood and some trunk hardware were also recovered from this lot, suggesting that the ammunition was deposited in a box.

Several service trenches were also identified. Lot 313 contained a ceramic pipe with bell and hub connectors (Lot 320) that might have been connected to a fire hydrant observed in one of the historic photographs of the yard (Plate 1). This pipe is not original to the Ordnance and Supply Yard but is part of a later addition as the MIMICO maker's mark indicates that it post-dates 1892. The presence of ceramic pipe fragments within Lot 313 suggests that Lot 320 replaced an older service line.

A second trench, Lot 341, was located west of the military store. This service trench was probably excavated during the expansion of the compound as the glass swirl marble recovered from Lot 341 provides a good terminus post quem date of 1900. Given its angle, it serviced the military store as its direction does not align with the locations of any of the buildings in the expanded Ordnance and Supply Yard compound.

Refuse disposal increased in the second half of the nineteenth-century and the first decade of the twentieth in response to the construction of the Ordnance and Supply Yard. Refuse was deposited abutting the

military store outside of the compound and several interesting artifacts including a few marked smoking pipe fragments and a porcelain doll fragment date to this period. The area also continued to be employed for military training purposes as can be seen from the Canadian Militia button, the 1910 wagon plate, and some armament items, like the Westley Richards bullets, the minié balls, and several tightly-dated .303 shells/bullets that date to this period.

The most significant modification to the Ordnance and Supply Yard took place as a result of the greater demands placed on the Toronto garrison during the First World War. While Fort York continued to be utilized for munitions storage, homes for officers' families, and training, the First World War placed new demands for these activities and the Ordnance and Supply Yard was expanded westward into much of the area subject to the Stage 4 salvage excavation.

Two new structures were built – an annex to the military store and a carpenter shop. The forge was added later in the 1920s. Most artifacts recovered from the field work date to this period and the utilization of these structures from the First World War onward. Using the three Depot Battalion epaulettes along with the epaulette from the 257th Infantry Battalion as evidence, it can be postulated that the expansion took place around 1916-1917 when the drawn out stalemate in Europe called for greater resources from the home front. Epaulettes from these reserve battalions reinforce the notion of Fort York being used for training new soldiers to be sent overseas.

The carpenter shop was constructed after the area had been leveled by removing some of the B-horizon (Lot 322) as well as bringing in soil to fill the natural crevices in the landscape (Lot 385). The artifacts recovered from Lot 385 support the First World War-era deposition of this lot. The shop measured 31.5 feet by 40.5 feet and was constructed on piles. Based on historic photographs the western section of the shop opened up to a pair of double doors that would have accommodated both horse-drawn and automotive vehicles.

The building was constructed with electrical wiring as can be surmised by the ASP Co. cleats recovered from the demolition layer (Lot 362). This is because the Akron Smoking Pipe Company changed its name and maker's mark in 1920, only a few years after the building was constructed. The electrical lines were probably strung along the mid-point of the building given the distribution of knobs within the central wall support post moulds for the decayed piles in this area. Further evidence that the building was fully electrified and that light bulbs were the main lighting devices are the ubiquitous nature of these artifacts in most lots and the large amount of milk glass ceiling lamp fragments recovered from Lots 362 and 393.

Other electrical artifacts included a deposit of tiny twentieth-century light bulbs used for something like a flashlight or another small lighting device and a large number of battery carbon rods that powered an indeterminate electrical object and were thrown outside of the building after they were spent. Several 125V fuses were also recovered revealing that an intricate electrical network was installed in this early twentieth-century building.

The work area was kept clean from debris as can be seen by the distribution of artifacts in the work surfaces layers. This would have been a requirement, especially if the carpenter shop serviced vehicles and other large wheeled pieces of equipment. Most of the material was swept to the sides of the shop or deposited in the small space between the west carpenter shop wall and the Ordnance and Supply Yard fence.

No structural evidence of the 1920s forge was found during the excavation and no significant subterranean features were identified. From the archival record it is known that the building was a 10 foot by 12 foot structure with a roof and three walls consisting of galvanized iron, with the fourth side

being left open. Unlike the carpenter shop, this building was supported by a frame of two by four scantlings.

The excavation did expose the main work area of the forge, Lots 364 and 365. The fire red sand in Lot 365 signified the location of the forge itself, however, the dimensions of the forge were more difficult to ascertain. The spread of smithing waste, Lot 353, extended way beyond the known historic boundaries of the forge. The high distribution of nails and window glass, especially on the southern edge of this debris field, hints at the location for one of the walls. Little else could be derived from the forge lots, however, a .303 rifle oil container was recovered from Lot 364 which is a unique find.

The forge facilitated the modification, maintenance, and repair of military equipment. This can be ascertained from the large amounts of ferrous and cuprous metal scrap recovered. Several shell casings were modified in an indeterminate idiosyncratic behaviour of sawing off the tops of the bullets for the removal of powder and/or cordite. The recovery of ruby red carriage or car tail lights is also interesting and indicates the presence and possible repair of such vehicles within the study area.

The shift from an open refuse disposal area to a twentieth-century military installation with frame buildings in this portion of the Garrison Common can also be observed among the percentages of the artifact classes. When early lots like Lot 322 and Lot 389 are compared to the upper strata like Lots 321, 354, 362, 390, and 391, not to mention the work surface lots, it can be seen that the relative amounts of architectural items increase through time while the percentages of domestic items, especially kitchen/food-related items, drop. Organic items and personal class items also tend to be less represented in the later periods while tools and equipment class items become slightly more prominent. This shift in the functional classes is directly related to the changes in function of the Garrison Common as it became more and more built up and militarized starting with the mid-nineteenth century.

As was discussed above, the midden also shifted from its pre-First World War location adjacent to the military store, northwest to the area created by the military store and its First World War-period annex. The yard itself was partially covered with a gravel surface as can be seen by the gravel layer identified in Lot 321 in most units between the carpenter shop/forge and the military store. A number of First World War-era objects were found in this excavation point to the area's eventual use as a military facility. They consist of the epaulettes, the .303 shells, the Webley revolver cleaning rod, and the "Honi soit qui mal y pense" Canadian military button. The .22 shell casings indicate that this area continued to be used as a militia base after the war.

The presence of pegged work shoes in the area, especially the one held together by cuprous pegs, reinforces the identification of this area as a military work yard. Out of 72 buttons from the entire assemblage, only two, the Canadian militia and the First World War military buttons discussed above, can be directly linked to military apparel. Looking at the photographs of the Ordnance and Supply Yard (Plate 1), it is likely that civilian contractors were hired to perform some of the tasks within the compound. The presence of civilian workmen is reinforced by the second-rate quality civilian vest recovered from the work surface of the carpenter shop, Lot 393.

While the kitchen and food-related artifacts represent a very small component of the artifact assemblage from the site, it is interesting to observe that 53 out of the 76 identifiable vessels are cups and saucers. This pattern of teaware representing a large percentage of ceramic vessels has been observed on Euro-Canadian domestic sites in southern Ontario (MacDonald 1997; 2004; Poulton and Dodd 2007). The ratio between teaware and non-teaware is different depending on the stratum in which they were found. In Lot 321, the ratio between teaware and non-teaware is 18 to five compared to Lot 322, where this ratio is 18 to 10. With the exception of the pre-1868 refuse-filled depressions, identifiable vessels in most small lots were predominantly teaware as well.

While some of the material originated in secondary deposits that represent cleaning episodes inside the walls of Fort York, the late nineteenth and early twentieth-century ceramics are indicative of work patterns at the Ordnance and Supply Yard. People came there to work. Thus, most of the food consumption activities were limited to lunch and tea breaks where teaware played an important role. The limited amount of food consumption would have occurred through the consumption of portable foods, such as sandwiches, or from the limited amount of plates and bowls recovered. Interestingly, most of the flatware consisted of inexpensive blue-edged plates suitable for a work space. Cheap, undecorated early twentieth-century enamelware was also utilized at the yard as can be seen from the identifiable cup, bowl, and supper plate recovered from the excavation.

The large amount of glass milk container fragments may also relate to tea consumption in this area. Of interest is the recovery of complete or almost complete Johnston Brothers milk bottles. Their business is tightly dated to 1916 - 1922, which ties neatly with the expansion of the Ordnance and Supply Yard during and slightly after the First World War. After they were discarded at least one became incorporated into the post holes for one of the Ordnance and Supply Yard fence posts.

The reconstruction of life at the Ordnance and Supply Yard would not be complete without a discussion of the representation of children in the archaeological record. It is known that they visited the yard as children are visible historical photos (see Plate 1). Therefore, some of the objects may have been lost in the yard on these visits. The toys along with civilian clothes, personal items, and the domestic food consumption items discussed above, speak to Fort York as a place where ordinary people played, ate, and went to work.

The Ordnance and Supply Yard was demolished in February of 1936. A large indeterminate pit, Lot 374/381 was dug into the floor of the carpenter shop for an unknown reason during the demolition process. Topsoil was spread over the area and grass was seeded as can be seen through the distribution of Lot 321 over the areas occupied by the carpenter shop and forge. The aerial photography shows a grass-covered Garrison Common in 1959 and several artifacts can be used to make the argument that this did not happen immediately after demolition. These include the 1941 Dominion Glass Company bottle from Lot 362 and the 1947 penny from Lot 353. The presence of these objects in these lots and not the overlying Lots 321 and 359 indicates that they either percolated downward through bioturbation or that significant A-horizon development did not start to take place until the late 1940s.

After the Ordnance and Supply Yard was demolished, a utility line was put through Garrison Common. A line of the grounding rods for these posts imbedded in sand and buttressed by wooden beans was identified during the excavation. This construction impacted several archaeological deposits related to the earlier occupation including the west wall of the military store and the Lot 341 service trench. Lot 301 covered these deposits as well, placing them within a 1936 to 1959 timeframe.

The A-horizon layers, Lots 321 and 359, were finally capped in 1960 during the construction of the Gardiner Expressway when new layers of fill were added to the stratigraphic record (Plate 4). Evidence for the construction of the Gardiner Expressway (Lot 92) defined the southern boundary of the excavation area. The final development of Garrison Common took place with the addition of gravel parking lot surfaces to create the modern landscape visible today.

In summary, the Stage 4 mitigative excavation for the building envelope of the Visitors' Centre at Fort York National Historic site (AjGu-26) resulted in the identification, documentation, and controlled excavation of 152 lots within a 370 square metre area and the collection of 35,284 Euro-Canadian and pre-contact artifacts. The excavation revealed a long history of the utilization of the Garrison Common, first by the First Nations people and then by the Fort York garrison. This area was part of the engagement that saw American forces invade York and the Grand Magazine explosion that resulted from that

invasion. It later saw the construction of the Ordnance and Supply Yard and its expansion during the First World War. It is this latter period that is best represented by the artifacts and the structures documented during the excavation. Thus, the construction of the Fort York Visitors' Centre has afforded the opportunity to study a twentieth-century archaeology component on a site better known for its pre-1900 history. The excavation revealed a complex and informative twentieth-century archaeological deposit that brings our knowledge of Fort York forward to the First World War. Thus, this Stage 4 mitigative excavation not only furthers our understanding of Fort York and Garrison Common but also brings to light the fact that much can be learned from the archaeology of the twentieth century.

14.0 RECOMMENDATIONS

Given the preceding information, it is concluded that:

- 1. There is no further heritage concern for the archaeological remains at Fort York National Historic Site (AjGu-26) located within that portion of the building envelope for the Visitors' Centre located east of the entrance drive that connects Fort York Boulevard to Garrison Road in the City of Toronto. It has been completely excavated and no further assessment or mitigation is required.
- 2. The deeply buried archaeological remains located within that portion of the footprint of the proposed Visitors' Centre located west of the entrance drive should be documented during construction by a way of a monitoring documentation agreement set up between a licensed archaeologist and the contractor.

NOTWITHSTANDING the results and recommendations presented in this study, Archaeological Services Inc. notes that no archaeological assessment, no matter how thorough or carefully completed, can necessarily predict, account for, or identify every form of isolated or deeply buried archaeological deposit. In the event that archaeological remains are found during subsequent construction activities, the consultant archaeologist, approval authority, and the Cultural Programs Unit of the Ministry of Tourism, Culture, and Sport should be immediately notified.

The above recommendation is subject to Ministry approval and it is an offence to alter any archaeological site without Ministry of Tourism, Culture and Sport (MTCS) concurrence. No grading or other activities that may result in the destruction or disturbance of any archaeological sites are permitted until notice of MTCS approval has been received.

15.0 ADVICE ON COMPLIANCE WITH LEGISLATION

In addition, the following advice on compliance is provided:

• This report is submitted to the Minister of Tourism, Culture, and Torture as a condition of licensing in accordance with Part VI of the Ontario Heritage Act, RSO 1990, c 0.18. The report is reviewed to ensure that it complies with the standards and guidelines that are issued by the Minister, and that the archaeological field work and report recommendations ensure the conservation, preservation and protection of the cultural heritage of Ontario. When all matters relating to archaeological sites within the project area of a development proposal have

been addressed to the satisfaction of the Ministry of Tourism, Culture, and Sport, a letter will be issued by the ministry stating that there are no further concerns with regard to alterations to archaeological sites by the proposed development.

- It is an offence under Sections 48 and 69 of the Ontario Heritage Act for any party other than a licensed archaeologist to make any alteration to a known archaeological site or to remove any artifact or other physical evidence of past human use or activity from the site, until such time as a licensed archaeologist has completed archaeological field work on the site, submitted a report to the Minister stating that the site has no further cultural heritage value or interest, and the report has been filed in the Ontario Public Register of Archaeology Reports referred to in Section 65.1 of the Ontario Heritage Act.
- Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48 (1) of the Ontario Heritage Act. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out archaeological fieldwork, in compliance with sec. 48 (1) of the Ontario Heritage Act.
- The Cemeteries Act, R.S.O 1990 c. C.4 and the Funeral, Burial and Cremation Services Act, 2002, S.O. 2002. c.33 (when proclaimed in force) require that any person discovering human remains must immediately notify the police or coroner and the Registrar of Cemeteries, Ministry of Consumer Services.
- Archaeological sites recommended for further archaeological field work or protection remain subject to Section 48(1) of the Ontario Heritage Act and may not be altered, nor may artifacts be removed from them, except by a person holding an archaeological license.

17.0 PHOTOGRAPHIC PLATES

Plate 5: The mechanical excavator begins removing the gravel parking lot surface in Trench 1 on the eastern periphery of the excavation area, looking southwest.

Plate 6: Looking east down Trench 1. Note surveyor's stakes in the foreground.

Plate 7: Opening up Trench 4 on the western periphery of the excavation area, looking southwest.

Plate 8: Block excavation in Trench 2 during the summer of 2010, looking northeast.

Plate 9: Block excavation in Trench 3 during the fall of 2010, looking southeast.

Plate 10: Relic gully filled in with Lot 322, looking northwest.

Plate 11: Lot 321 in unit 701N-299E displaying the gravel lens, looking south.

Plate 12: Profile of Lot 334, refuse-filled depression, looking north.

Plate 13: Refuse-filled depressions, Lots 327 and 330, looking west in Trench 2.

Plate 14: Profiles of refuse-filled depressions, Lots 327 and 330, looking northeast.

Plate 15: Exposed kettle in Lot 332, refuse-filled depression/pit, looking east.

Plate 16: Lot 43, Ordnance and Supply Yard paved surface, looking northeast.

Plate 17: Profile of Lot 309 (soil)/Lot 312 (wood), support pile for the military store, looking north.

Plate 18: Profile of Lot 318, pile for the military store, looking southeast.

Plate 19: Profile of Lot 317, pile for the military store, looking northeast.

Plate 20: Lots 313 and 320 running into the northeast corner of the excavation, looking north.

Plate 21: Profile of Lot 363, west wall pile for the carpenter shop, looking west.

Plate 22: Profile of Lot 432 and Lot 433 which together make up an east wall pile for the Carpenter Shop, looking west.

Plate 23: Profile of Lot 400, central pile for the Carpenter Shop, and Lot 399 its cap, looking north.

Plate 24: Plan of units 705N-278E and 705N-279E, where Lot 393 abutted Lot 384, looking north.

Plate 25: Lot 431, looking north.

Plate 26: Lots 425 and 427, looking north.

Plate 27: Lot 353, the Forge deposit, over Lot 354, the buried A-horizon, looking southwest.

Plate 28: Lot 368, the wall remnant, imbedded into Lot 354 in unit 704N-285E, looking east.

Plate 29: Plan view of units 705N-287E and 706N-287E showing the relationships between Lots 353, 354, 364, and 365, looking east.

Plate 30: Lot 365 reddish discolouration, looking west.

Plate 31: Lots 341 and 361, looking north.

Plate 32: Units 699N-274E and 700N-274E, showing the relationship between Lots 389, 390, 391, and 392 with Lots 404 and 409 present, looking northeast.

Plate 33: Western profile of unit 702N-274E showing the relationships between Lots 321, 362, 389, 390, 391, and 322.

Plate 34: Unit 706N-291E looking northwest and displaying the relationship between Lots 359, 353, 354, and 322.

Page 156

Plate 35: Lots 314, 340, and 342, support structure for the utility pole grounding rods, fully exposed, looking southeast.

Plate 36: Lots 419 and 420, indeterminate post, looking southwest.

Plate 37: Lot 377/381 in relationship to the other lots on the 283E line, looking west.

Plate 38: Lot 377/381 cutting through Lots 303, 322, and 384, looking north.

Plate 39: Teacups. Left, olde blue-printed teacup from Lot 322 (Cat. #4197); right, bone china teacup with decalcomania motif from Lot 301 (Cat. #2202).

Plate 40: Saucers. Top, late palette-painted refined white earthenware saucer from Lot 322 (Cat. #4639). Bottom. Left, late palette-painted sprig motif on a refined white earthenware saucer from Lot 321 (Cat. #6143); right, monochrome blue-painted pearlware saucer from Lot 391 (Cat. #1473).

Plate 41: Refined white earthenware saucer with late palette-painted sprig motif from Lot 322 (Cat. #5762).

Plate 42: Moulded but not painted pearlware muffin plate from Lot 322 (Cat. #4815).

Plate 43: Assorted flatwares. Top, blue scalloped and embossed refined white earthenware meat dish from Lot 354 (Cat. #1830). Bottom. Left, olde blue-printed refined white earthenware twiffler plate with a scalloped rim from Lot 327 (Cat. 4258); right, blue-printed refined white earthenware muffin plate from Lot 322 (Cat. 6025).

Plate 44: Edgewares. Top, blue straight edged plate from Lot 322 (Cat. #5763); bottom left, blue scalloped edged plate from Lot 322 (Cat. #3635); bottom right, blue straight edged plate from Lot 321 (Cat. #5801).

Plate 45: Personal adornment. Top. Left, clay bead from Lot 362 (Cat. #12505); right, hexagonal glass bead from Lot 322 (Cat. #12415). Bottom. Left, ring from Lot 353 (Cat. #13370); right, mother of pearl collar stud from Lot 301 (Cat. #11960).

Plate 46: Military badges. Top, lion head badge from Lot 322 (Cat. #12400); bottom, maple leaf cap badge fragments from Lot 321 (Cat. #12315).

Plate 47: 2nd Depot Battalion 1st Regiment Central Ontario epaulette from Lot 322 (Cat. #21345).

Plate 48: Almost complete pipe with the regal coat of arms from Lot 322 (Cat. #12372).

Plate 49: Buttons. Top, glass button from Lot 408 (Cat. #11387). Bottom. Left, stained bone button from Lot 322 (Cat. #13465); right, metal suspender button from Lot 398 (Cat. #11956).

Plate 50: Canadian Militia button from Lot 322 (Cat. #12330).

Plate 51: Prosser buttons from the Stage 4 excavation. Top. Left, four-hole button with a painted red edge from Lot 301 (Cat. #11845); right, two-hole sew-through black button from Lot 389 (Cat. #11350). Bottom. Left, four-hole button from Lot 443 (Cat. #12935); centre, four-hole button from Lot 389 (Cat. #12125); right, four-hole button from Lot 322 (Cat. #11750).

Plate 52: Counter-marked "CD" coin from Lot 322 (Cat. #12605).

Plate 53: X-Ray image of the CD coin from Lot 322 (Cat. #12,605).

Plate 54: Marbles from the excavation. Top. Left, clay marble from Lot 322 (Cat. #12870); centre, glazed clay marble from Lot 390 (Cat. #11835); right, swirl glass marble from Lot 321 (Cat. #11880). Bottom. Left, spiral glass marble from Lot 301 (Cat. #12642); centre, swirl glass marble from Lot 362 (Cat. #7082); right, swirl glass marble from Lot 341 (Cat. #13380).

Plate 55: One of the cuprous barrel hoops twisted in the Grand Magazine explosion from Lot 322 (Cat. #20721).

Plate 56: Stoneware container from Lot 322 (Cat. #3675).

Plate 57: Red carriage/car tail light from Lot 322 (Cat. #8396).

Plate 58: Whistle from Lot 322 (Cat. #20601).

Plate 59: Lithics. Top. Left, Onondaga shatter fragment from Lot 321 (Cat. #L2); centre, Onondaga distal flake fragment from Lot 321 (Cat. #L3); right, Kettle point distal flake fragment from Lot 321 (Cat. #L4). Bottom. Left, Onondaga distal flake fragment with dorsal and lateral retouch from Lot 321 (Cat. #L5); centre, Bois Blanc shatter fragment from Lot 322 (Cat. #L6); right, Lockport shatter fragment from Lot 321 (Cat. #L10).

Plate 60: Indoor electric porcelain. Top. Left, socket/adapter fragment from Lot 301 (Cat. #12443); centre, plaster/ceramic light bulb base from Lot 301 (Cat. #12692); right, porcelain light bulb base from Lot 321 (Cat. #11530). Middle. Left, "ASP. Co." three-wire cleat from Lot 362 (Cat. #12260); right, telephone knob from Lot 301 (Cat. #4915). Bottom. Left, light switch from Lot 321 (Cat. #12320); centre, wall sconce from Lot 301 (Cat. #5523); right, two-part bayonet ceiling sconce from Lot 362 (Cat. #13016).

Plate 61: Bowls. Left, late palette-painted bowl from Lot 321 (Cat. #5324); right, brown-printed bowl from Lot 384 (Cat. #5607).

Plate 62: Ironstone preserve jar with late palette painted sprig motif from Lot 321 (Cat. #5776).

Plate 63: One of the pewter buttons from Lot 321 (Cat. #13395).

Plate 64: X-ray of the other pewter button rom Lot 321 (Cat. #13545).

Plate 65: Goodyear machine-sewn shoe that has been reinforced with pegs from Lot 321 (Cat. #13436).

Plate 66: Friction tube from Lot 321 (Cat. #21554).

Plate 67: Mid-nineteenth-century bullets. Left, Westley Richards bullet from Lot 321 (Cat. #12026); right, minié balls from Lot 354 (Cat. #12255).

Plate 68: .303 bullets. Left, hollow point (Cat. #13125); centre, rounded point (Cat. #11656); right, pointed (Cat. #12691).

Plate 69: Snider-Enfield rifle trigger guard from Lot 321 (Cat. #22367).

Plate 70: Pistol cleaning rod from Lot 321 (Cat. #22308).

Plate 71: Most common shell casings from the project. Top, .303 shell casing from Lot 321 (Cat. #12291). Bottom. Left, shotgun shell from Lot 385 (Cat. #11585); right, .22 shell casings from Lot 321 (Cat. #13556).

Plate 72: Sawn .303 shell casing from Lot 321 (Cat. #11770).

Plate 73: Children's toys. Porcelain doll head from Lot 321 (Cat. #11660) and a porcelain doll arm from Lot 362 (Cat. #12975).

Plate 74: Wagon registration plate from Lot 321 (Cat. #12875).

Plate 75: Blue-printed refined white earthenware saucer in the "Villaris" pattern by Davenport from Lot 327 (Cat. #4272).

Plate 76: Kettle from Lot 332 (Cat. #22683).

Plate 77: Factory-slipped, London-shape refined white earthenware bowl from Lot 332 (Cat. #2695).

Plate 78: Blue edged pearlware salt shaker from Lot 332 (Cat. #2675).

Plate 79: Blank .303 rounds with crimped heads from Lot 317 (Cat. #11786).

Plate 80: Blank .303 round from Lot 317 from which powder has been extracted (Cat. #11785).

Plate 81: Thermally altered teacup filled with slag from Lot 385 (Cat. #2283).

Plate 82: Smoking pipes. Top. Left, Turk's Head pipe bowl from Lot 384 (Cat. #13036); right, ribbed pipe bowl from Lot 393 (Cat. #11985). Bottom, complete bowl and partial stem from Lot 385 (Cat. #11985).

Plate 83: Veneer bottle from Lot 385 (Cat. #7577).

Plate 84: Ironstone toothbrush container from Lot 393 (Cat. #4942) and toothbrush from Lot 362 (Cat. #13230).

Plate 85: Second-rate twill vest from Lot 393, note the button holes on the right (Cat. #18181).

Plate 86: Carbon battery rods from Lot 393 (Cat. #12185).

Plate 87: Tiny light bulb from Lot 394 (Cat. #13040).

Plate 88: A .303 rifle oil container from Lot 364 (Cat. #13080).

Plate 89: Milk bottles from Lot 438. Left, Johnston Bros. Oakland Dairy (Cat. #8690); right, City Dairy (Cat. #8679).

Plate 90: Green-printed ironstone saucer from Lot 389 (Cat. #4320).

Plate 91: Ornate shell button from Lot 389 (Cat. #11560).

Plate 92: Pinfire shotgun shell from Lot 390 (Cat. #12425).

Plate 93: Percussion caps from Lot 391. Top left Cat. #20202, top right Cat. #20049, bottom left Cat. #20023, bottom right Cat. #20058.

Plate 94: Warped musket ball from Lot 391 (Cat. #21318).

Plate 95: CANADA epaulette from Lot 359 (Cat. #13306).

Plate 96: Short and squat ironstone cup from Lot 301 (Cat. #4921).

Plate 97: Moulded ironstone mug from Lot 301 (Cat. #4460).

Plate 98: Left, pegged child's shoe heel fragment from Lot 301 (Cat. #12420); pegged adult shoe with cuprous pegs from Lot 301 (Cat. #12980)

Plate 99: Infantry epaulettes from Lot 301. Top Cat. #21330, bottom left Cat. #21331, bottom right Cat. #21332.

Plate 100: Epaulettes from Lot 301. Top, 257th Infantry Battalion epaulette from Lot 301 (Cat. #21653); bottom, two epaulettes from the 2nd Depot Battalion 2nd Regiment Central Ontario (Cat. #s 21658 and 21659).

Plate 101: Cat's eye marble from Lot 301 (Cat. #13215).

Plate 102: External electric insulators. Left, porcelain pin type insulator from Lot 301 (Cat. #12700); centre, porcelain wire holder insulator from Lot 385 (Cat. #11980); right, glass saddle insulator from Lot 301 (Cat. #9995).

Plate 103: Dominion Glass Company mark on an indeterminate container from Lot 301 (Cat. #6556).

Stage 4 Salvage Excavation of the Proposed Visitors' Centre at Fort York National Historic Site (AjGu-26) City of Toronto
